March 23, 2021

Caitlyn Nichols Environmental Analyst II Division of Environmental Permits, Region 2 New York State Department of Environmental Conservation 47-40 21st Street Long Island City, NY 11101

Re: Department of Corrections, Rikers Island – DECID: 2-6007-00259/00033 Title V Permit Renewal 3 Application

Dear Ms. Nichols:

AKRF, Inc. is enclosing a draft Title V Air Permit renewal 3 application package for the New York City Department of Correction (DOC), Rikers Island facility located at 17-25 Hazen Street in East Elmhurst, NY. This permit is for renewal of the Title V permit, which expired in January 2018.

A revised renewal application was submitted to the Department on June 24, 2020. AKRF, Inc. received administrative comments from the Department on July 15, 2020 and a subsequent Notice of Incomplete Application with technical comments on the renewal application and the modeling report from the Department on August 19, 2020. This revised renewal application addresses all administrative and technical comments received and includes a revised 1-hr NO₂ air dispersion modeling analysis and modeling report, SEQR Full Environmental Assessment Form Part 1, Draft Environmental Justice Analysis, and Draft Public Participation Plan.

Included with this permit renewal application are the following documents:

- Title V Renewal Application including:
 - Permit Application Forms;
 - The Use of ERC form;
 - The list of exempt activities;
 - The methods used to determine compliance;
 - o Emissions Calculations;
 - o NO_x RACT analyses for the PLM Engines and Boilers;
 - o LAER analysis for the Cogeneration Turbines;
 - o 1-hour NO₂ air dispersion modeling analysis report and backup files;
- SEQRA Full Environmental Assessment Form, Part 1;

- Draft Environmental Justice Analysis; and
- Draft Public Participation Plan

We appreciate the Department's review of this permit renewal. Please feel free to contact Jennifer Franco at (914) 922-2366 or me, at (646) 388-9796 or <u>hkearney@akrf.com</u> if you need further information.

Sincerely,

Hang Keanen

NAICS Codes									
9221									
Facility Description									

THE NEW YORK CITY DEPARTMENT OF CORRECTION (NYC DOC) MAINTAINS A PRISON FACILITY ON RIKERS ISLAND IN THE EAST RIVER, NEAR BOTH THE BOROUGHS OF QUEENS AND THE BRONX. A POWERHOUSE OPERATES IN A SEPARATE STRUCTURE ON THE ISLAND, PRODUCING STEAM TO PROVIDE HEAT FOR THE ENTIRE ISLAND, AS WELL AS PROCESS STEAM FOR THE LAUNDRY.

THE POWERHOUSE HAS HAS:

fo En 1. EIGHT BOILERS WITH A CAPACITY OF 96 MMBTU/HR EACH, FIRING NATURAL GAS OR DISTILLATE OIL AS BACK UP. THE EIGHT BOILERS WERE RETROFITTED WITH LOW NOX BURNERS, UTILIZING NATURAL GAS AS THE PRIMARY FUEL AND #2 FUEL OIL AS BACK UP. THE EIGHT BOILERS EXHAUST THROUGH EMISSION POINTS U00001, U00002, AND U00003.

2. SPRAY PAINT BOOTH (U00009), WHICH IS LOCATED IN THE GARAGE WHERE THE VEHICLES ARE SERVED. THE SPRAY BOOTH IS USED FOR PAINTING REPAIRED PARTS OF BUSES AND VEHICLES FOR THE DOC. THE MAXIMUM ANNUAL EMISSIONS OF VOC FROM THE PAINTING PROCESS ARE LIMITED TO 2.5 TONS PER YEAR.

3. -NINETEEN (10) INTERNAL COMBUSTION ENCINES IN A PEAK LOAD MANAGEMENT (PLM) PROGRAM WITH CON EDISON, THE LOCAL UTILITY (U00010).- THESE ENGINES, PERMITTED ON 7/17/2007, ARE SUBJECT TO A NOX EMISSION CAP OF 22.5 TONS PER YEAR:- FIFTEEN OF THE NINETEEN ENGINES ARE PERMITTED TO OPERATE UNDER NOX RAST VARIANCE EMISSION LIMITS.

4. TWO 7.5 MW NATURAL CAS FIRED SIMPLE CYCLE CAS TURBINES EQUIPPED WITH DUCT FIRING HEAT RECOVERY STEAM GENERATORS (HRSSS) AND ONE 2 MW EMERGENCY BLACKSTART ENSINE GENERATOR. THE COGENERATION PLANT IS BEING PERMITTED UNDER NEW EMISSION UNIT US0011. NOX AND PM10 EMISSIONS ARE PROPOSED TO BE CAPPED AT 42:00 TPY, AND 15.77 TPY, RESPECTIVELY IN ORDER TO AVOID NANSR AND PSD APPLICADILITY. RELATIVE TO VOC AND PM2.5 TOTAL EMISSIONS ARE LESS THAN 25 TPY AND 100 TPY, RESPECTIVELY, THEREFORE, NANSR IS NOT APPLICABLE TO THESE POLLUTANTS. UNDER 201 6.2. THE FACILITY IS ACCEPTING A PERMIT CONDITION PROHIBITING THE PROPOSED COCENERATION PLANT FROM COMMENSIONS CONSTRUCTION OF UNTIL AFTER THE CLOSE OF THE CONTEMPORANEOUS PERIOD FOR THE PLM UNITS, WHICH IS 747/2012.

See below for new #3 and #4 proposed text

Compliance Statements (Title V Only)

	If one c applica section	y that as of the date of this application the facility is in compliance with all applicable requirements X YES NO or more emission units at the facility are not in compliance with all applicable requirements at the time of signing this attion (the 'NO' box must be checked), the noncomplying units must be identified in the "Compliance Plan" block of IN V of this form along with the compliance plan information required. For all emission units at this facility that are and in compliance with all applicable requirements complete the following:	
	X	This facility will continue to be operated and maintained in such manner as to assure compliance for the duration of the permit, except those units referenced in the compliance plan portion of Section IV of this application.	
	X	For all emission units, subject to any applicable requirements that will become effective during the term of the permit, this facility will meet all such requirements on a timely basis.	
	X	Compliance certification reports will be submitted at least once a year. Each report will certify compliance status with respect to each requirement, and the method used to determine status.	
I A E U	SON, THE AR. FOURT NINETEE RTEEN (14 GINES THA	(19) INTERNAL COMBUSTION ENGINES (U00010) HAVE THE OPTION TO ENROLL IN A PEAK LOAD MANAGEMENT (PLM) PROGRAM WITH CON LOCAL UTILITY. THESE NINETEEN (19) ENGINES WERE PERMITTED ON 7/17/2007, AND ARE SUBJECT TO A NOX EMISSION CAP OF 22.5 TONS PI TEEN (14) OF THE NINETEEN (19) ENGINES HAVE UNDERGONE NOX STACK TESTING TO DETERMINE COMPLIANCE WITH NOX RACT. FIVE (5) O EN (19) WERE NOT STACK TESTED AND CANNOT PARTICIPATE IN THE PLM PROGRAM UNTIL THEY ARE STACK TESTED. THE REMAINING 4) STACK TESTED ENGINES ARE PERMITTED TO OPERATE UNDER NOX RACT VARIANCE EMISSION LIMITS. FOUR (4) OF THE FOURTEEN (14) AT HAVE A NOX RACT VARIANCE WILL NOT OPERATE UNDER PLM PROGRAMS DUE TO THE POTENTIAL FOR EXCEEDANCES OF THE 1-HOUR 20 NAAQS, AS DETERMINED THROUGH THE AIR DISPERSION MODELING ANALYSIS PERFORMED IN MARCH 2020.	
"	WO 7.5 MV	W NATURAL GAS-FIRED COGENERATION TURBINES FOUIPPED WITH DUCT FIRING HEAT RECOVERY STEAM GENERATORS (HRSGS) AND ONE	t.

1.5 MW EMERGENCY BLACKSTART ENGINE GENERATOR. THE COGENERATION PLANT IS PERMITTED UNDER EMISSION UNIT U00011. NOX EMISSIONS ARE

CAPPED AT 52.00 TPY TO COMPLY WITH NANSR AND PSD. ALL OTHER POLLUTANTS ARE IN COMPLIANCE WITH NANSR AND PSD.

Description Peak Load Management (PLM)

Each stationary internal combustion engine listed may participate in GDRP/RLM program only after demonstrating compliance with NOX emission limit of 2.3 grams per brake horsepower- hour and receiving the Department's approval of the emission test results.

If an engine cannot meet the NOx limit of 2.3 grams/bhp-hr, and still wants to participate in CDRP/PLM program, the facility must submit an application for permit modification along with a variance request as per 6 NYCRR Part 227-2.5(c) and Air Guide 20.

Description and March 2020

This condition becomes effective on or after July 1, 2014 Alternative NOx emissions limit 0.12 lbs/mmbtu applies to eight mid size boilers (Emission Sources: 0001-0008) listed in Emission Unit U-00001, U-00002 and U-00003 as demonstrated in December 2011 NOx RACT analysis. analyses.

Once during the term of the Title V permit, the facility must perform NOx emission stack test, as per Department approved test protocol. Results of the stack test must be submitted to the Department within 60 days after completion of the test.

Section IV - Emission Unit Information

Emission Unit Description

 Emission Unit
 U00001

 THIS EMISSION UNIT IS COMPRISED OF 4 KEELER 96 MMBTU/HR BOILERS, EACH CAPABLE OF PRODUCING 70,000 LB/HR OF

THIS EMISSION UNIT IS COMPRISED OF 4 KEELER 90 MIMBTO/RR BOILERS, EACH CAPABLE OF PRODUCING 70,000 LB/RR OF 150 PSI STEAM. EACH BOILER IS RETROFITTED WITH TWO LOW NOX & BURNERS. THE FOUR BOILERS DISCHARGE THROUGH A COMMON STACK. EMISSION SOURCES LISTED UNDER THIS EMISSION UNIT 00001, 00002, 00003 AND 00004 ARE THE BOILERS NUMBERED AS 6,7,8 & 9 IN THE NOX RACT AVERAGING COMPLIANCE PLAN SUBMITTED ON 10/5/01. OPERATION OF THESE FOUR BOILERS TO BEING OURTAILED AND ERGO ARE BEING APPLIED FOR AND USED AS INTERNAL OFFSETS.

Description

Each owner or operator required to operate a Continuous Opacity Monitoring System (COMS) in accordance with subdivision (a) of this section shall submit an accurate excess emissions and monitoring system performance report to the department for each calendar year quarter. All reports shall be certified by a responsible corporate official as true, accurate and complete and postmarked by the 60th day following the end of each calendar quarter. The quarterly excess emissions report shall be submitted in a form acceptable to the department and shall include the following minimum information:

(1) the magnitude, date and time of each six minute block average during which the average opacity of emissions exceeds 20 percent, except for one six minute block average per hour not to exceed 27 percent;

(2) for each period of excess emission, specific identification of the cause and corrective action taken;

(3) identification of all periods of COMS downtime, including the date, time and duration of each inoperable period, and the cause and corrective action for each COMS downtime period;

(4) the total time in which the COMS are required to record data during the reporting period;

(5) the total number of exceedences and the duration of exceedences expressed as a percentage of the total time in which the COMS are required to record data; and

(6) such other things as the department may deem necessary, proper or desirable in order to enforce article 19 of the Environmental Conservation Law or the rules promulgated thereunder.

is conditio	condition will become effective upon the commercial operation of cogeneration plant in Emission Unit U-00011.											
 M-10 emission from four boilers in this emission unit U-00002 are limited to 0.28 tons per year. 1.05 tpy PM-10 ERCs are created for the w cogeneration project in emission unit U-00011 by boiler operation curtailment. The following formula shall be used to calculate the onthly PM-10 emissions and to demonstrate compliance with this cap on a rolling 12-month basis: ((A x B) + (C x D))/2000 ere: = monthly PM-10 emissions(tons); = the monthly fuel consumption of number 2 oil in the two existing boilers (00005, 00006) (1000 gallons); = PM-10 AP 42 Emission Factor (lbs/1000 gallons); = the monthly fuel consumption of natural gas in the two existing boilers(mmscf); = PM-10 AP 42 Emission Factor (lbs/1000 gallons); = the monthly fuel consumption of natural gas in the two existing boilers(mmscf); = PM-10 AP 42 Emission Factor (lbs/1000 gallons);

Section IV - Emission Unit Information

Emission Unit Description

Emission Unit U00003

THIS EMISSION UNIT IS COMPRISED OF ONE KEELER 96 MMBTU/HR BOILER, AND ONE UNION IRON WORKS BOILER, EACH CAPABLE OF PRODUCING 70,000 LB/HR OF 150 PSI STEAM. EACH BOILER IS RETROFITTED WITH TWO LOW NOX BURNERS. THE TWO BOILERS DISCHARGE THROUGH A COMMON STACK. EMISSION SOURCES LISTED UNDER THIS EMISSION UNIT, 00007, 00008 ARE THE BOILERS NUMBERED AS 4 & 5 IN THE NOX RACT AVERAGING COMPLIANCE PLAN SUBMITTED ON 10/5/01. OPERATION OF THESE TWO BOILERS IN BEING CURTAILED AND ERCS ARE BEING APPLIED FOR AND USED AS INTERNAL-OFFSETS.

Section IV - Emission Unit Information

Emission Unit Description

 Emission Unit
 U00009

A spray paint booth has been installed in the garage for motor vehicle refinishing. The spray paint booth is used 4 hrs/day, 235 days/yr. Emission exhaust stack will be located above the roof of the garage.

Description that have the option of enrolling

Firing oil number 2 diesel oil. This unit consists of nineteen (19) generators opermitted to participate in NYPA sponsored CDRP/PLM programs. However, only fifteen generators will participate in CDRP/PLM programs up on grant variance. In addition to regular testing and emergency, these generators will be operated during peak loading conditions, for an average of 65 hours a year per generator.

New York State Department of Environmental ConservationPermit ID: 2-6007-00259/00033Facility DEC ID: 2600700259

the inadequacies, and permittee shall have 90 days to revise its prospective record keeping format in a manner acceptable to the Department.

Parameter Monitored: OPACITY Upper Permit Limit: 20 percent Reference Test Method: EPA Method 9 Monitoring Frequency: DAILY Averaging Method: 6-MINUTE AVERAGE (METHOD 9) Reporting Requirements: SEMI-ANNUALLY (CALENDAR) Reports due 30 days after the reporting period. The initial report is due 4/30/2013. Subsequent reports are due every 6 calendar month(s).

Condition # 71 should be included under compliance Certification for Emission Unit U-00010 (the 19 generators)

Condition 71: Capping Monitoring Condition Effective between the dates of 01/03/2013 and 01/02/2018

Applicable Federal Requirement:6 NYCRR Subpart 201-7

Item 71.1:

Under the authority of 6 NYCRR Part 201-7, this condition contains an emission cap for the purpose of limiting emissions from the facility, emission unit or process to avoid being subject to the following applicable requirement(s) that the facility, emission unit or process would otherwise be subject to:

6 NYCRR Subpart 231-2

Item 71.2:

Operation of this facility shall take place in accordance with the approved criteria, emission limits, terms, conditions and standards in this permit.

Item 71.3:

The owner or operator of the permitted facility must maintain all required records on-site for a period of five years and make them available to representatives of the Department upon request. Department representatives must be granted access to any facility regulated by this Subpart, during normal operating hours, for the purpose of determining compliance with this and any other state and federal air pollution control requirements, regulations or law.

Item 71.4:

On an annual basis, unless otherwise specified below, beginning one year after the granting of an emissions cap, the responsible official shall provide a certification to the Department that the facility has operated all emission units within the limits imposed by the emission cap. This certification shall include a brief summary of the emissions subject to the cap for that time period and a comparison to the threshold levels that would require compliance with an applicable requirement.

Item 71.5:

The emission of pollutants that exceed the applicability thresholds for an applicable requirement, for which the facility has obtained an emissions cap, constitutes a violation of Part 201 and of the Act.

Item 71.6:

The Compliance Certification activity will be performed for: Emission Unit: U-00010 Process: GEN Regulated Contaminant(s): CAS No: 0NY210-00-0 **OXIDES OF NITROGEN** Item 71.7: Compliance Certification shall include the following monitoring: Capping: Yes Monitoring Type: MONITORING OF PROCESS OR CONTROL DEVICE PARAMETERS AS SURROGATE Monitoring Description: Total annual NOx emissions from this emission unit PLM/CDRP operation is limited to 22.5 tons per year. The NOx emissions for each engine must be monitored and based on the emission factors obtained from the most recent stack testing and the hours of operation. Daily log must be maintained at the site which shows the starting time and the ending time of operation for each engine. Parameter Monitored: OXIDES OF NITROGEN Upper Permit Limit: 22.5 tons per year Monitoring Frequency: MONTHLY Averaging Method: 12 MONTH AVERAGE - ROLLED MONTHLY Reporting Requirements: ANNUALLY (CALENDAR) Reports due 30 days after the reporting period. The initial report is due 10/30/2013. Subsequent reports are due every 12 calendar month(s). **Condition 72: Compliance Certification** Effective between the dates of 01/03/2013 and 01/02/2018 Applicable Federal Requirement: 6 NYCRR 227.2 (b) (1) Item 72.1: The Compliance Certification activity will be performed for: Emission Unit: U-0001 Emission Point: 00010 Process: GEN Regulated Contaminant(s CAS No: 011075-00-0 PARTICULATES Item 72.2: Compliance Certification shall include the following monitoring: Monitoring Type: INTERMITTENT EMISSION TESTING Air Pollution Control Permit Conditions

Description

Within 180 days after the commencement of sogeneration plant, facility shall conduct PM 2.5 stack emission testing for turbines(with and without duct firing) to determine PM 2.5 emission factors as per EPA approved stack testing method to demonstrate that cogeneration plant PM 2.5 net emission increases are less than the 6 NYCRR part 231 significant net emission increase threshold of 10 tpy.

A report demonstrating the compliance shall be submitted in the Department within 60 days of the test.

Stack test protocol shall be submitted to the Department for approval at least 30 days prior to the test.

Description

Facility must perform a NOx emission stack test, as per Department approved stack test protocol to determine NOx emission factors (used in 6 NYCRR Part 201-7 capping condition) for the turbines(00029 and 00030) with and without duct firing HRSGs(00031 and 00032).

Permit conditions for 40 CFR 60 4320(a) and 40 CFR 60 4340(a) require facility to perform NOx emission stack test for turbines at least every two years. This stack test shall also determine turbine NOX emission factors with and without duct firing.

Attached conditions 76 on the next page (marked in red box) should be included under Compliance Certification.

New York State Department of Environmental Conservation Facility DEC ID: 2600700259

Permit ID: 2-6007-00259/00033

Item 75.2: Compliance Certification shall include the following monitoring; Monitoring Type: RECORD KEEPING/MAINTENANCE ROCEDURES Monitoring Description: Within 180 days after the commencement of cogeneration plant, facility shall conduct PM 2.5 stack emission testing for turbines(with and without duct firing) to determine PM 2.5 emission factors as per EPA approved stack testing method to demonstrate that cogeneration plant PM 2.5 net emission increases are less than the 6 NYCRR part 231 significant net emission increase threshold of 10 tpy. A report demonstrating the compliance shall be submitted to the Department within 60 days of the test. Stack test protocol shall be submitted to the Department for approval at least 30 days prior to the test.

Condition # 76 should be included under compliance Certification

for Emission Unit U-00011 (Cogen Plant) Reference Test Method: EPA approved 201 A or 202 Monitoring Frequency: AS REQUIRED - SEE PERMIT MONITORING DESCRIPTION Averaging Method: AVERAGING METHOD AS PER REFERENCE TEST METHOD INDICATED Reporting Requirements: AS REQUIRED - SEE MONITORING DESCRIPTION

Condition 76: Capping Monitoring Condition Effective between the dates of 01/03/2013 and 01/02/2018

Applicable Federal Requirement: 6 NYCRR Subpart 201-7

Item 76.1:

Under the authority of 6 NYCRR Part 201-7, this condition contains an emission cap for the purpose of limiting emissions from the facility, emission unit or process to avoid being subject to the following applicable requirement(s) that the facility, emission unit or process would otherwise be subject to:

6 NYCRR 231-6.4

Item 76.2:

Operation of this facility shall take place in accordance with the approved criteria, emission limits, terms, conditions and standards in this permit.

Item 76.3:

The owner or operator of the permitted facility must maintain all required records on-site for a period of five years and make them available to representatives of the Department upon request. Department representatives must be granted access to any facility regulated by this Subpart, during normal operating hours, for the purpose of determining compliance with this and any other state and federal air pollution control requirements, regulations or law.

Item 76.4:

On an annual basis, unless otherwise specified below, beginning one year after the granting of an emissions cap, the responsible official shall provide a certification to the Department that the facility has operated all emission units within the limits imposed by the emission cap. This certification shall include a brief summary of the emissions subject to the cap for that time period and a comparison to the threshold levels that would require compliance with an applicable requirement.

Item 76.5:

The emission of pollutants that exceed the applicability thresholds for an applicable requirement, for which the facility has obtained an emissions cap, constitutes a violation of Part 201 and of the Act.

Item 76.6:

The Compliance Certification activity will be performed for:

Emission Unit: U-00011

Regulated Contaminant(s): CAS No: 0NY210-00-0 OXIDES OF NITROGEN

Item 76.7:

Compliance Certification shall include the following monitoring:

Capping: Yes Monitoring Type: MONITORING OF PROCESS OR CONTROL DEVICE PARAMETERS AS SURROGATE

Monitoring Description:

This condition will become effective upon the commercial operation of the new cogeneration plant in Emission Unit U-00011.

NOx emissions from this emission unit shall not exceed 42-52.0 tpy.

On a monthly basis, facility must calculate total annual NOX emissions of two turbines and duct firing HRSGs and emergency blackstart generator using the following formula to demonstrate compliance with the cap on a rolling 12-month basis:

X = ((A X B) + (C X D) + (E x F))/2000

Where,

X = monthly NOx emission(tons);

A = the monthly fuel consumption of natural gas in the two turbines (00029 and 00030) mmscf with duct firing HRSGs (00031 and 00032) mmscf; B = NOx emission factor from the operation of the

turbines with duct firing from the most recent stack test(lbs/mmscf).

C = the monthly fuel consumption of natural gas in the

New York State Department of Environmental ConservationPermit ID: 2-6007-00259/00033Facility DEC ID: 2600700259

 turbines without duct firing HRSGs D = NOx emission factor from the operation of the turbines without duct burners from the most recent stack test(lbs/mmscf); E = the monthly fuel consumption of #2 fuel oil oin the emergency blackstart generator(10000)gallons; F = NOx emission factor lb/1000 gallon: NSPS 40 CFR 60 Subpart IIII For Tier 2 engine category, (NMHC+ NOx) standard is 6.4 g/KW-hr. A rolling 12-month tally shall be maintained at the facility ensure compliance with the limit, and summary of the calculations shall be submitted to the Department.
Parameter Monitored: OXIDES OF NITROGEN Upper Permit Limit: 42 tons per year 52.0 Reference Test Method: 40 CFR Appendix A Monitoring Frequency: MONTHLY Averaging Method: 12-month total, rolled monthly Reporting Requirements: SEMI-ANNUALLY (CALENDAR) Reports due 30 days after the reporting period. The initial report is due 4/30/2013. Subsequent reports are due every 6 calendar month(s).
Condition 77: Capping Monitoring Condition Effective between the dates of 01/03/2013 and 01/02/2018
Applicable Federal Requirement:6 NYCRR Subpart 201-7
Item 77.1: Under the authority of 6 NYCRR Part 201-7, this condition contains an emission cap for the purpose of limiting emissions from the facility, emission unit or process to avoid being subject to the following applicable requirement(s) that the facility, emission unit or process would otherwise be subject to:
6 NYCRR 231-6.4
Item 77.2: Operation of this facility shall take place in accordance with the approved criteria, emission limits, terms, conditions and standards in this permit.
Item 77.3: The owner or operator of the permitted facility must maintain all required records on-site for a period of five years and make them available to representatives of the Department upon request. Department representatives must be granted access to any facility regulated by this Subpart, during normal operating hours, for the purpose of determining compliance with this and any other state and federal air pollution control requirements, regulations or law.
Item 77.4:

On an annual basis, unless otherwise specified below, beginning one year after the granting of an

The above condition 40 CFR 60.4415, NSPS Subpart KKKK should be removed since the facility has elected not to monitor the sulfur content of the gas combusted in the turbine; instead the facility maintains sulfur content records provided by the fuel supplier to demonstrate that the sulfur content in the fuel is below the maximum limits.

Attached condition 81 on the next page (marked in red box) should be included under Compliance Certification. The facility maintains sulfur content records provided by the fuel supplier on-site.

Attached conditions 86 and 87 on the next page (marked in red box) should also be included under Compliance Certification.

New York State Department of Environmental Conservation

Permit ID: 2-6007-00259/00033

Facility DEC ID: 2600700259

Condition # 81 should be included under compliance Certification for Emission Unit U-00011 (Cogen Plant)

Averaging Method: 3-HOUR BLOCK AVERAGE

Reporting Requirements: AS REQUIRED - SEE MONITORING DESCRIPTION

Condition 81: Compliance Certification Effective between the dates of 01/03/2013 and 01/02/2018

DESCRIPTION

Applicable Federal Requirement:40CFR 60.4365(a), NSPS Subpart

KKKK

Item 81.1:

The Compliance Certification activity will be performed for:

Emission Unit: U-00011

Regulated Contaminant(s): CAS No: 007446-09-5 SULFUR DIOXIDE

Item 81.2:

Compliance Certification shall include the following monitoring:

Monitoring Type: RECORD KEEPING/MAINTENANCE PROCEDURES Monitoring Description:

The facility may elect not to monitor the total sulfur content of the fuel combusted in the turbine, if the fuel is demonstrated not to exceed potential sulfur emissions of 26 ng SO2/J (0.060 lb SO2/mmBtu) heat input.

The facility must use the fuel quality characteristics in a current, valid purchase contract, tariff sheet, or transportation contract for the fuel, specifying that:

1) The maximum total sulfur content for oil use is 0.05%by weight (500 ppmw) or less, or 2) The total sulfur content for natural gas use is 20 grains of sulfur or less per 100 standard cubic feet,

or

3) Has potential sulfur emissions of less than 26 ng SO2/J (0.060 lb SO2/mmBtu) heat input.

Monitoring Frequency: AS REQUIRED - SEE PERMIT MONITORING DESCRIPTION Reporting Requirements: SEMI-ANNUALLY (CALENDAR)

Reports due 30 days after the reporting period. The initial report is due 4/30/2013.

Subsequent reports are due every 6 calendar month(s).

Condition 82: NOx performance testing methodology Effective between the dates of 01/03/2013 and 01/02/2018

Applicable Federal Requirement:40CFR 60.4400(b), NSPS Subpart

New York State Department of Environmental Conservation Permit ID: 2-6007-00259/00033 Facility DEC ID: 2600700259

14 calendar months following the previous performance test).

Performance tests shall be conducted according to the test methodologies listed in 60.4415(a)(1)-(3) as applicable.

Conditions # 86 & 87 should be included under compliance Certification for Emission Unit U-00011 (Cogen Plant)

Monitoring Frequency: AS REQUIRED - SEE PERMIT MONITORING DESCRIPTION Reporting Requirements: SEMI-ANNUALLY (CALENDAR) Reports due 30 days after the reporting period. The initial report is due 4/30/2013. Subsequent reports are due every 6 calendar month(s).

Description

The owner or operator of a 2007 model year or later emergency stationary compression ignition (CI) internal combustion engine with a maximum engine power greater than or equal to 37 kW (50 HP but less than or equal to 2,237 kW (3,000 HP), that is not a fire pump engine, and has a displacement of less than 10 liters per cylinder must comply with the emission standards specified in 40 CFR 89.112 and 40 CFR 89.113, as applicable, for all pollutants, for the same model year and maximum engine power.

Compliance with this requirement will be established by purchasing an engine certified to the applicable emission standard referenced above and installed and configured according to the manufacturer's specifications. Records documenting these actions must be kept on-site.

Description An air dispersion modeling analysis to determine compliance with 1-hour NO2 NAAQS was performed in support of the												
Title V Renewal application.												
The engine (ES:00011) located at the George R. Vierno Center (GRVC) Building is permitted to participate in PLM programs.												
As a result of the modeling analysis, the maximum capacity for this engine is capped at 638 KW while operating in a PLM program. The facility will track and record the Kilowatt output while the engine is operating in PLM programs. Records will be kept on site.

List of Exempt Activities

Instructions

Applicants for Title V facility permits must provide a listing of each exempt activity, as described in 6 NYCRR Part 201-3.2(c), that is currently operated at the facility. This form provides a means to fulfill this requirement.

In order to complete this form, enter the number and building location of each exempt activity. Building IDs used on this form should match those used in the Title V permit application. If a listed activity is not operated at the facility, leave the corresponding information blank.

	Combustion		
Rule Citation 201-3.2(c)	Description	Number of Activities	Building Location
(1)	Stationary or portable combustion installations where the furnace has a maximum heat input capacity less than 10 mmBtu/hr burning fuels other than coal or wood; or a maximum heat input capacity of less than 1 mmBtu/hr burning coal or wood. This activity does not include combustion installations burning any material classified as solid waste, as defined in 6 NYCRR Part 360, or waste oil, as defined in 6 NYCRR Subpart 225-2.		
(2)	Space heaters burning waste oil at automotive service facilities, as defined in 6 NYCRR Subpart 225-2, generated on-site or at a facility under common control, alone or in conjunction with used oil generated by a do-it-yourself oil changer as defined in 6 NYCRR Subpart 374-2.		
(3)(i)	Stationary or portable internal combustion engines that are liquid or gaseous fuel powered and located within the New York City metropolitan area or the Orange County towns of Blooming Grove, Chester, Highlands, Monroe, Tuxedo, Warwick, or Woodbury, and have a maximum mechanical power rating of less than 200 brake horsepower.		
(3)(ii)	Stationary or portable internal combustion engines that are liquid or gaseous fuel powered and located outside of the New York City metropolitan area or the Orange County towns of Blooming Grove, Chester, Highlands, Monroe, Tuxedo, Warwick, or Woodbury, and have a maximum mechanical power rating of less than 400 brake horsepower.		
(3)(iii)	Stationary or portable internal combustion engines that are gasoline powered and have a maximum mechanical power rating of less than 50 brake horsepower.		
(4)	Reserved.		
(5)	Gas turbines with a heat input at peak load less then 10 mmBtu/hour		

	DEC ID 7 - 0 0 2 5 9		
Rule Citation 201-3.2(c)	Description	Number of Activities	Building Location
(6)	Emergency power generating stationary internal combustion engines, as defined in 6 NYCRR Part 200.1(cq), and engine test cells at engine manufacturing facilities that are utilized for research and development, reliability performance testing, or quality assurance performance testing. Stationary internal combustion engines used for peak shaving and/or demand response programs are not exempt.	55	
	Combustion Related		
(7)	Non-contact water cooling towers and water treatment systems for process cooling water and other water containers designed to cool, store or otherwise handle water that has not been in direct contact with gaseous or liquid process streams.		
	Agricultural		
(8)	Feed and grain milling, cleaning, conveying, drying and storage operations including grain storage silos, where such silos exhaust to an appropriate emissions control device, excluding grain terminal elevators with permanent storage capacities over 2.5 million U.S. bushels, and grain storage elevators with capacities above one million bushels.		
(9)	Equipment used exclusively to slaughter animals, but not including other equipment at slaughterhouses, such as rendering cookers, boilers, heating plants, incinerators, and electrical power generating equipment.		
	Commercial - Food Service Industries		
(10)	Flour silos at bakeries, provided all such silos are exhausted through an appropriate emission control device.		
(11)	Emissions from flavorings added to a food product where such flavors are manually added to the product.		
	Commercial - Graphic Arts		
(12)	Screen printing inks/coatings or adhesives which are applied by a hand-held squeegee. A hand-held squeegee is one that is not propelled though the use of mechanical conveyance and is not an integral part of the screen printing process.		
(13) 3/30/2015	Graphic arts processes at facilities located outside the New York City metropolitan area or the Orange County towns of Blooming Grove, Chester, Highlands, Monroe, Tuxedo, Warwick, or Woodbury whose facility-wide total emissions of volatile organic compounds from inks, coatings, adhesives, fountain solutions and cleaning solutions are less than three tons during any 12-month period.		Page 2 of 6

Building

Location

DEC ID 2 - 6 0 0 7 - 0 0 2 5 9 Rule Number Citation Description of 201-3.2(c) Activities Graphic label and/or box labeling operations where the inks are applied by stamping (14)or rolling. Graphic arts processes which are specifically exempted from regulation under 6 (15)NYCRR Part 234, with respect to emissions of volatile organic compounds which are not given an A rating as described in 6 NYCRR Part 212. **Commercial - Other** Gasoline dispensing sites registered with the department pursuant to 6 NYCRR Part (16)612. Surface coating and related activities at facilities which use less than 25 gallons per month of total coating materials, or with actual volatile organic compound emissions of 1,000 pounds or less from coating materials in any 12-month period. Coating materials include all paints and paint components, other materials mixed with paints prior to application, and cleaning solvents, combined. This exemption is subject to the following: (17) (i) The facility is located outside of the New York City metropolitan area or the Orange County towns of Blooming Grove, Chester, Highlands, Monroe, Tuxedo, Warwick, or Woodbury; and (ii) All abrasive cleaning and surface coating operations are performed in an enclosed building where such operations are exhausted into appropriate emission control devices. Abrasive cleaning operations which exhaust to an appropriate emission control (18) device. (19)Ultraviolet curing operations. Municipal/Public Health Related Landfill gas ventilating systems at landfills with design capacities less than 2.5 million megagrams (3.3 million tons) and 2.5 million cubic meters (2.75 million cubic yards), (20)where the systems are vented directly to the atmosphere, and the ventilating system has been required by, and is operating under, the conditions of a valid 6 NYCRR Part 360 permit, or order on consent. **Storage Vessels** Distillate fuel oil, residual fuel oil, and liquid asphalt storage tanks with storage (21)14 capacities below 300,000 barrels.

DEC ID 2 - 6 0 0 7 - 0 0 2 5 9 Rulo

Rule Citation 201-3.2(c)	Description	Number of Activities	Building Location
(22)	Pressurized fixed roof tanks which are capable of maintaining a working pressure at all times to prevent emissions of volatile organic compounds to the outdoor atmosphere.		
(23)	External floating roof tanks which are of welded construction and are equipped with a metallic-type shoe primary seal and a secondary seal from the top of the shoe seal to the tank wall.		
	External floating roof tanks which are used for the storage of a petroleum or volatile organic liquid with a true vapor pressure less than 4.0 psi (27.6 kPa), are of welded construction and are equipped with one of the following: (i) a metallic-type shoe seal;		
(24)	(ii) a liquid-mounted foam seal; (iii) a liquid-mounted liquid-filled type seal; or		
	(iv) equivalent control equipment or device.		
(25)	Storage tanks, including petroleum liquid storage tanks as defined in 6 NYCRR Part 229, with capacities less than 10,000 gallons, except those subject to 6 NYCRR Part 229 or Part 233.		
(26)	Horizontal petroleum or volatile organic liquid storage tanks.		
(27)	Storage silos storing solid materials, provided all such silos are exhausted through an appropriate emission control device. This exemption does not include raw material, clinker, or finished product storage silos at Portland cement plants.		
	Industrial		
(28)	Processing equipment at existing sand and gravel and stone crushing plants which were installed or constructed before August 31, 1983, where water is used for operations such as wet conveying, separating, and washing. This exemption does not include processing equipment at existing sand and gravel and stone crushing plants where water is used for dust suppression.		
(29)(i)	Sand and gravel processing or crushed stone processing lines at a non-metallic mineral processing facility that are a permanent or fixed installation with a maximum rated processing capacity of 25 tons of minerals per hour or less.		

DEC ID 2 - 6 0 0 7 - 0 0 2 5 9 Rule

Rule Citation 201-3.2(c)	Description	Number of Activities	Building Location
(29)(ii)	Sand and gravel processing or crushed stone processing lines at a non-metallic mineral processing facility that are a portable emission source with a maximum rated processing capacity of 150 tons of minerals per hour or less.		
(29)(iii)	Sand and gravel processing or crushed stone processing lines at a non-metallic mineral processing facility that are used exclusively to screen minerals at a facility where no crushing or grinding takes place.		
(30)	Reserved.		
(31)	Surface coating operations which are specifically exempted from regulation under 6 NYCRR Part 228, with respect to emissions of volatile organic compounds which are not given an A rating pursuant to 6 NYCRR Part 212.		
(32)	Pharmaceutical tablet branding operations.		
(33)	Thermal packaging operations, including, but not limited to, therimage labeling, blister packing, shrink wrapping, shrink banding, and carton gluing.		
(34)	Powder coating operations.		
(35)	All tumblers used for the cleaning and/or deburring of metal products without abrasive blasting.		
(36)	Presses used exclusively for molding or extruding plastics except where halogenated carbon compounds or hydrocarbon solvents are used as foaming agents.		
(37)	Concrete batch plants where the cement weigh hopper and all bulk storage silos are exhausted through fabric filters, and the batch drop point is controlled by a shroud or other emission control device.		
(38)	Cement storage operations not located at Portland cement plants where materials are transported by screw or bucket conveyors.		
(39)(i)	Cold cleaning degreasers with an open surface area of 11 square feet or less and an internal volume of 93 gallons or less or, having an organic solvent loss of 3 gallons per day or less.		
39(ii)	Cold cleaning degreasers that use a solvent with a VOC content or five percent or less by weight, unless subject to the requirements of 40 CFR 63 Subpart T.		
3/30/2015		Г	Page 5 of 6

DEC ID 2 - 6 0 0 7 - 0 0 2 5 9 Rule Number Building Citation Description of Location 201-3.2(c) Activities Conveyorized degreasers with an air/vapor interface smaller than 22 square feet (2 (39)(iii) square meters), unless subject to the requirements of 40 CFR 63 Subpart T. Open-top vapor degreasers with an open-top area smaller than 11 square feet (1 (39)(iv) square meter), unless subject to the requirements of 40 CFR 63 Subpart T. Miscellaneous Ventilating and exhaust systems for laboratory operations. Laboratory operations do (40) not include processes having a primary purpose to produce commercial quantities of materials. Exhaust or ventilating systems for the melting of gold, silver, platinum and other (41) precious metals. Exhaust systems for paint mixing, transfer, filling or sampling and/or paint storage rooms or cabinets, provided the paints stored within these locations are stored in (42) closed containers when not in use. Exhaust systems for solvent transfer, filling or sampling, and/or solvent storage (43)rooms provided the solvent stored within these locations are stored in containers when not in use. Research and development activities, including both stand-alone and activities within (44)a major facility, until such time as the administrator completes a rule making to determine how the permitting program should be structured for these activities. (45) The application of odor counteractants and/or neutralizers. (46)Hydrogen fuel cells. Dry cleaning equipment that uses only water-based cleaning processes or those using (47)liquid carbon dioxide. (48)Manure spreading, handling and storage at farms and agricultural facilities.

Notes:

NOx PTEs are based on the NOx RACT limits of 0.12 lbs/mmBtu on natural gas and #2 Oil.
 CO, VOC, SO2, PM10, and PM2.5 PTEs are obtained from Federal AP-42 emission factors.

2. Annual Actual emissions are based on fuel usage estimates obtained from emission statements for 2016-2018.

3. Annual PTE emissions assume 8,760 hours of operation on either natural gas or fuel oil.

1 Executive Summary

On May 22, 2018, the New York State Department of Environmental Conservation (NYSDEC) Region 2 office received an application for the renewal of the Rikers Island (Rikers) Air Title V Facility (Title V) permit (Permit ID: 2-6007-00259/00033). NYSDEC has requested that the New York City Department of Corrections (DOC) submit a revised Reasonably Available Control Technology (RACT) analysis for oxides of nitrogen (NO_x) for the fifteen (15) Rikers internal combustion engines that have source-specific NO_x RACT emission limits under a NO_x RACT variance based on a NO_x RACT analysis dated June 11, 2008.

NYSDEC Region 2 also requested a revised analysis for all Rikers boilers that have a NO_x RACT variance. A separate NO_x RACT analysis has been prepared for the boilers and will be submitted under separate cover.

As specified in the current Title V permit, there are 19 internal combustion engines at Rikers that have the option of enrolling in a Peak Load Management (PLM) program. In addition, these 19 engines are subject to a NO_x emissions cap of 22.5 tons/year.

For 15 of the 19 engines, in addition to regular testing and emergency operations, the current Title V permit specified that they may be operated at the NO_x RACT variance limits when operating under the PLM program, for an average of 65 hours a year per generator.

Each of the remaining four engines may participate in the PLM program only after demonstrating compliance with the presumptive NO_x RACT emission limit of 2.3 grams per brake horsepower-hour (g/bhp-hr) prescribed at 6 NYCRR Part 227-2.4(f)(3). If these four engines cannot meet the presumptive NO_x RACT limit and NYC DOC still wants them to participate in the PLM program, the NYC DOC must submit an application for permit modification along with a variance request per 6 NYCRR Part 227-2.5(c) and NYSDEC Program Policy established in the Division of Air Resources (DAR)-*Economic and Technical Analysis for Reasonably Available Control Technology (RACT) Networks*,(DAR-20), August 8, 2013.

This NO_x RACT analysis was prepared to respond to NYSDEC Region 2's request to update the NO_x RACT analysis for the 15 engines with NO_x RACT variance emission limits, as required by DAR-20.

The analysis was conducted pursuant to the NYSDEC RACT requirements of 6 NYCRR Part 227-2 for stationary internal combustion engines, and DAR-20 guidelines.

The RACT analysis consists of identifying NO_x control technologies which meet feasibility standards for technical, economic, environmental, and energy performance. The following air pollution control technologies were considered in the RACT analysis for both technical and economic feasibility:

- Selective Catalytic Reduction (SCR);
- Selective Non-Catalytic Reduction (SNCR);
- Exhaust Gas Recirculation (EGR);
- Steam Injection Systems and Emulsified Fuels; and
- Injection Timing Retardation and Adjusted Cam Timing

In addition to the above air pollution control technologies, the analysis included an evaluation of the use of fuel switching and the use of a system averaging plan pursuant to 6 NYCRR 227-2.5(c).

The analysis presented in this report demonstrates that the available air pollution control technologies do not meet RACT requirements for the reduction of NO_x emissions from the engines. Consequently, adding air pollution control technology or modifying the engines cannot be justified because these options are either technically or economically infeasible.

As a result, RACT for 14 of the 15 engines is determined to be no control, as defined in NYSDEC DAR-20. These 14 engines, therefore, are considered to be in compliance with Part 227-2 either at the existing NO_x variance limit in the current Title V permit or at a new limit based upon the most recent stack testing conducted in 2018, as presented in Table 4. Stack testing will be performed once during the permit term to demonstrate compliance with these limits.

One engine (Emission Source 00027, 1,150 KW Caterpillar 3512) was mechanically unavailable during the 2018 stack testing effort and may not return to service. The Rikers Title V permit will be revised to remove the current Title V Condition 116 relating to Emission Source 00027, and add Emission Source 00027 to the current Title V Condition 98, which requires that each engine listed may participate in the PLM program only after demonstrating compliance with the presumptive NO_x RACT emission limit of 2.3 g/bhp-hr and receiving the Department's approval of the emission test results. If an engine cannot meet the 2.3 g/bhp-hr limit, and DOC wishes to include the engine in the PLM program, then DOC must submit an application for a permit modification along with a variance request as per 6 NYCRR Part 227-2.5(c) and DAR-20.

2 Introduction

On May 22, 2018, the New York State Department of Environmental Conservation (NYSDEC) Region 2 office received an application for the renewal of the Rikers Island (Rikers) Air Title V Facility permit (Title V) permit (Permit ID: 2-6007-00259/00033). NYSDEC has requested that the DOC submit a revised RACT analysis for NO_x for the fifteen (15) diesel fuel-fired internal combustion engines that have source-specific NO_x RACT emission limits under a NO_x RACT variance based on a NO_x RACT analysis dated June 11, 2008.

NYSDEC Region 2 also requested a revised analysis for all Rikers boilers that have a NO_x RACT variance. A separate NO_x RACT analysis has been prepared for the boilers and will be submitted under separate cover.

This NO_x RACT analysis presents the evaluation of several emission control alternatives and the selection of RACT for the 15 diesel fuel-fired PLM engines at Rikers.

2.1 Source Background

DOC operates nineteen (19) diesel fuel-fired internal combustion engines at Rikers that have the option of enrolling in a Peak Load Management (PLM) program. In addition, these 19 engines are subject to a NO_x emissions cap of 22.5 tons/year.

For 15 of the 19 engines, in addition to regular testing and emergency operations, the current Title V permit specified that they may be operated at the NO_x RACT variance limits when operating under the PLM program, for an average of 65 hours a year per generator.

The 19 engines are grouped under Emission Unit U-00010 (EU 00010). The emission unit consists of the 19 engines with generators with the rated outputs as follows:

- four @ 1,100 KW;
- two @ 800 KW;
- three @ 900 KW;
- one @ 625 KW; and
- nine @ 1,150 K.

Fifteen of the engines were tested in May 2008 with emissions above the presumptive NO_x RACT limit of 2.3 g/bhp-hr and below 9.0 g/bhp-hr. The emission rates measured during the testing for these engines became the alternative NO_x RACT limits found in Conditions 102 - 116 of the current Title V permit. These emissions rates are also used to demonstrate compliance with the 22.5 tons/year NO_x emissions cap prescribed in Condition 71.

Four of the engines were not available for testing in May 2008. As currently written in the Title V permit, testing of these four engines will be performed at a later date based on NYSDEC's approval and will not participate in a PLM program until a variance/approval is sought. The emission factor that must be used for these four generators (should they ever be operated in the future) when demonstrating compliance with the 22.5 tons/year cap is the maximum level tested in 2008, i.e., 9.0 g/bhp-hr.

Each of these four engines may participate in the PLM program only after demonstrating compliance with the presumptive NO_x RACT emission limit of 2.3 grams per brake horsepower-hour (g/bhp-hr) prescribed at 6 NYCRR Part 227-2.4(f)(3). If these four engines cannot meet the presumptive NO_x RACT limit and DOC still wants them to participate in the PLM program, the DOC must submit an application for permit modification along with a variance request per 6 NYCRR Part 227-2.5(c) and DAR-20 RACT analysis guidelines.

NYSDEC Region 2 also requested a revised analysis for all Rikers boilers that have a NO_x RACT variance. A separate NO_x RACT analysis has been prepared for the boilers and will be submitted under separate cover.

2.1.1 Previous NO_x RACT Analysis

In 2008, the DOC submitted a NO_x RACT analysis (dated June 11, 2008) for 15 of the 19 engines making up EU 00010.¹ This analysis established the NO_x RACT variance limits listed in Conditions 102-106 of the current Rikers Title V permit and the NO_x RACT analysis date of June 11, 2008 is quoted in several places in the Rikers Title V permit.

The previous analysis analyzed the economic costs of two vendor options for the technically feasible addition of a Selective Catalytic Reduction (SCR) system on each engine, assuming that each engine operated during the PLM program for 65 hours/year. Based on the cost of the technology, use of SCR to reach 2.3 gm/bhp-hr could not be considered RACT for the 15 engines.

The NO_x RACT variance limits established by the June 11, 2008 NO_x RACT analysis, which were based on testing conducted in May 2008, became the NO_x emission limits currently listed under Conditions 102 - 116.

2.1.2 NO_x Emissions

Pursuant to the Title V permit requirement to test each engine during the permit term, Environmental Laboratories, Inc. (ELI) tested 14 of the 15engines during the period August 21 through September 7, 2018.²

The four engines not tested in 2008 (Emission Sources 00021, 00023, 00026, and 00028) again were mechanically unavailable for testing, as well as Emission Source 00027, one of the 1,150 KW Cat 3512 engines that is part of the PLM group of 15 engines that is the subject of this NO_x RACT analysis.

The results of the performance testing are provided in Table 1, along with the current Title V NO_x limit for each engine. Table 1 shows that the measured NO_x emission levels exceeded the current permit alternative NO_x RACT limits for five of the 14 emission sources that were operational during the testing: 00011 and 00016 – 00019. The emission rates ranged from 4.50 g/bhp-hr (Emission Source 00015) to 9.20 g/bhp-hr (Emission Source 00011).

For the purposes of this RACT determination, similar to the 2008 NO_x RACT analysis, the economic analysis NO_x potential to emit was established using the measured emission rates shown in Table 1 and assuming each engine operates during the PLM program for 65 hours per year.

This RACT analysis was conducted by evaluating air pollution control technologies that can reduce the baseline emissions to a level at or below the Part 227-2 presumptive NO_x RACT limit of 2.3 g/bhp-hr.

2.2 RACT Requirements and Process

New York State's 6 NYCRR Part 200 defines RACT as the: "Lowest emission limit that a particular source is capable of meeting by application of control technology that is reasonably available, considering technological and economic feasibility." New York State has a guideline document, DAR-20, for conducting RACT analyses.

¹ NO_x *RACT Analysis for Operation of Fifteen Generators in Demand Reduction Program*, Environmental Engineering Solutions, P.C., June 11, 2008.

² Compliance Test Report – NO_x and PM Emissions Evaluation, NYC-DOC Rikers Island, Environmental Laboratories, Inc., October 29, 2018.

The provisions of Part 227-2 apply to major stationary sources of NO_x for different types of combustion equipment burning different fuels.

RACT requirements applicable to a particular emission source may fall into one of two categories - presumptive RACT limits or case-by-case RACT determinations. Presumptive RACT limits are category-wide requirements. Presumptive RACT limits are based on capabilities that are general to an emission source category. However, for some categories of emission sources, presumptive RACT limits may not be attainable at every individual emission source. Case-by-case RACT determinations consider the technological and economic circumstances of the individual emission source.

Specific requirements for stationary internal combustion engines are prescribed at 6 NYCRR 227-2.4(f). Rikers is located in an area that is currently designated as a moderate nonattainment area for the 2015 ozone National Ambient Air Quality Standard, and all of the EU 00010 engines are greater than 400 brake horsepower and fire distillate oil. Therefore, pursuant to 6 NYCRR 227-2.4(f)(3), the engines must comply with a NO_x emission limit of 2.3 g/bhp-hr or a case-by-case RACT determination.

According to 6 NYCRR 227-2.5(c), for those sources that demonstrate that the applicable presumptive RACT emission limit in section 227-2.4 is not economically or technically feasible, the owner or operator can request the NYSDEC to set a higher emission source specific emission limit.

DOC has elected to perform a RACT analysis to demonstrate compliance with Part 227-2 for the 14 engines per Part 227-2.4(f). The RACT analysis consists of identifying NO_x control technologies which meet feasibility standards for technical, economic, environmental, and energy performance.

The selection of RACT for the NO_x sources described herein was made using the "top-down" approach for evaluating control technologies. The "top-down" analysis method stipulates that available control technologies first be assessed for technical feasibility, including both demonstrated and transferable technologies with practical potential application to the source. Options which are considered technically feasible are then ranked for control effectiveness in descending order. The environmental, economic, and energy impacts of the "top" (most stringent) control alternatives are examined first.

Each feasible technology must undergo an economic analysis, consisting of an evaluation of the lowest of actual budgetary bids from vendors. A total annualized equipment cost based on the installed capital cost (and capital recovery factor) and operations and maintenance costs must be determined, then divided by the tons of NO_x controlled each year to determine the technology's cost effectiveness in dollars per ton NO_x reduced (\$/ton). Per DAR-20, a source will not be required to implement any emission control or strategy if the resultant cost exceeds the \$5,300/ton³ cost threshold that defines economic feasibility. This RACT analysis follows these procedures.

After technical, economic, environmental, and energy analyses have been completed, the overall impact of each alternative is either determined to be "reasonably available" and selected as RACT or is rejected due to "unreasonable" economic, energy, or environmental impacts. The most stringent technology not rejected is designated as RACT for the source.

As a result of this analysis, DOC is requesting that the NYSDEC set a higher emission source specific emission limit for each engine than the 2.3 g/bhp-hr prescribed at 6 NYCRR 227-2.4(f).

³ RACT cost threshold was established as \$3,000/ton in 1994 dollars. The NYSDEC uses the Bureau of Labor Statistics CPI Inflation Calculator to adjust this \$3,000 economic feasibility threshold over time for inflation (http://www.bls.gov/data/inflation_calculator.htm).

a—Conversion from KW to BHP assumes 92% generator efficiency and 0.7457 KW/bhp.

b—Emission Source 00017 while operational was observed to be experiencing severe mechanical issues.

c-Emission Source 00027 was determined to be non-operational and out of commission and as result was not available for emission testing.

d—Per Condition 98, the engine may participate in the PLM program only after demonstrating compliance with a NO_x emission limit of 2.3 g/bhphr and receiving the Department's approval of the emission test results.

e—Out of operation during testing.

3 Available Control Technologies and Strategies

There are two primary mechanisms by which NO_x is formed in an internal combustion (IC) engine: (1) the oxidation of atmospheric nitrogen found in the combustion air (thermal NO_x) and (2) the conversion of nitrogen chemically bound in the fuel (fuel-bound NO_x or organic NO_x). These mechanisms are discussed below.

Thermal NO_x is created by the high temperature reaction in the combustion chamber between atmospheric nitrogen and oxygen. The amount that is formed is a function of time, turbulence, temperature, and the fuel to air ratio within the combustion flame zone. The majority of NO_x emissions result from thermal NO_x generation.

Fuel-bound NO_x is created by the gas-phase oxidation of the elemental nitrogen contained within the fuel. Its formation is a function of the fuel nitrogen content and the amount of oxygen in the combustion chamber. Most IC engines are presently fueled by natural gas or light distillate oil that typically contains little or no fuel-bound NO_x. As a result, when compared to thermal NO_x, fuel NO_x is not currently a major contributor to overall NO_x emissions from most IC engines.⁴

A third form of NO_x , prompt NO_x , is formed during the oxidation of molecular nitrogen present in the combustion air stream in areas of the flame envelope that are fuel rich. In most cases, prompt NO_x emissions are negligible.

Nitrogen oxides emission controls are divided into two categories: post-combustion emission reduction and in-engine combustion control. Post-combustion NO_x controls reduce a portion of the NO_x exiting the combustion zone to nitrogen. In-engine formation controls reduce the quantity of NO_x formed during the combustion process.

In addition to potentially feasible control technologies, this section evaluates fuel switching and the use of a system averaging plan as per 6 NYCRR 227-2.5(c) because DOC is requesting that NYSDEC set emission limits for the 14 engines that are higher than the presumptive NO_x RACT levels for stationary internal combustion engines prescribed in 227-2.4.

3.1 Potentially Feasible Control Technologies

Descriptions of potentially feasible control technologies in both categories, post-combustion and inengine control, are provided below.

3.1.1 Post-Combustion NO_x Control Technologies

Post-combustion NO_x control processes reduce NO_x emissions by converting NO_x in the exhaust stream to nitrogen gas and water. SCR is the primary post-combustion NO_x removal technology used for internal combustion engines. Selective non-catalytic reduction (SNCR) is also a potentially feasible control technology.

3.1.1.1 Selective Catalytic Reduction (SCR)

SCR is a post-combustion control technology that can significantly reduce NO_x emissions from internal combustion engines. In an SCR system, ammonia (NH_3) or urea is injected into the exhaust where it reacts with NO_x in the presence of a catalyst (typically a metal oxide) to form nitrogen (N_2) and water.

⁴ Alternative Control Techniques Document -- NO_x Emissions from Stationary Reciprocating Internal Combustion Engines, EPA-453/R-93032, U.S. EPA, July 1993.

The following equations describe the SCR reaction process:

 $4NO + 4NH_3 + O_2 \rightarrow 4N_2 + 6H_2O$ $6NO_2 + 8NH_3 \rightarrow 7N_2 + 12H_2O$

 $NH_3 + O_2 \rightarrow NO_x + H_2O$

The first and second equations represent the NO_x reduction reaction. The third equation represents the formation of NO_x by a side reaction in an SCR system if the actual temperature exceeds the optimum reaction temperature. At very high temperatures, NO_x emissions actually increase and SCR is counterproductive.

The above discussion illustrates how temperature is a key SCR performance parameter. The NO_x reduction reaction is effective only within a given temperature range. In an SCR system, the optimum temperature depends on two reaction components: the type of catalyst and the flue gas composition. According to EPA's *Control Cost Manual*,⁵ for the majority of commercial catalysts (metal oxides), the operating temperatures for the SCR process range from 480°F to 800°F. The rate of NO_x removal increases with temperature up to a maximum between 700°F and 750°F. As the temperature increases above 750°F, the reaction rate and resulting NO_x removal efficiency begin to decrease.

The exhaust gas temperatures measured during the 2018 testing (500-820°F) are within the range at which SCR is effective at reducing NO_x .

According to EPA's *Control Cost Manual* SCR systems can typically achieve NO_x removal efficiencies at or above 90%.

3.1.1.2 Selective Non-Catalytic Reduction (SNCR)

SNCR is a post-combustion NO_x control technology in which a reagent (anhydrous ammonia or urea) is injected into the flue gas stream to react chemically with NO_x , forming nitrogen gas and water. The relevant reaction is:

 $2NO + CO \cdot (NH_2)_2 + \frac{1}{2}O_2 \rightarrow 2N_2 + CO_2 + 2H_2O$

The success of this process in reducing NO_x emissions is highly dependent on the ability to achieve uniform mixing of the reagent into the flue gas. Without the use of a catalyst, the reaction requires a high temperature range to obtain activation energy. This must occur within a zone of the exhaust stream where the flue gas temperature is within a narrow range, typically from 1,600°F to 2,100°F. In order to achieve the necessary mixing and reaction, the residence time of the flue gas within this temperature window should be at least 0.5 to 1.0 second. The consequences of operating outside the optimum temperature range are severe. Above the upper end of the temperature range, the reagent will be converted to NO_x and the NO_x control efficiency decreases rapidly. Below the lower end of the temperature range, the reagent will not react with the NO_x and the NH₃ discharge from the stack (known as "ammonia slip") will be very high. The normal NO_x control efficiency range for SNCR is 50 percent to 70 percent.

⁵ EPA Air Pollution Control Cost Manual, Seventh Edition, available at <u>https://www.epa.gov/economic-and-cost-analysis-air-pollution-regulations/cost-reports-and-guidance-air-pollution</u>

SNCR is most appropriate for applications with high exhaust gas temperatures (1,600 to 1,800°F), while the exhaust gas temperature of the engines at Rikers are much lower (500 to 820°F). At the observed exhaust temperature range, SNCR would not provide NO_x control and thus will not be considered further for this application.

3.1.2 In-Engine NO_x Control Technologies

In-engine technologies that have been demonstrated to reduce NO_x emissions include exhaust gas recirculation, steam injection systems and emulsified fuels, adjusted engine timing, and operational controls such as modified operating schedules and good combustion practices.

3.1.2.1 Exhaust Gas Recirculation (EGR)

EGR reintroduces exhaust gas from the system outlet into the combustion air system. Recirculation of exhaust gas lowers the flame temperature, which reduces the formation of thermal NO_x. EGR is most effectively applied as a control technology as part of a new engine installation. Retrofitted EGR systems for existing engine installations are possible but require significant development and design costs. EGR retrofits can also be harmful to the engine. In particular, the recirculation of exhaust gas back into the engine cylinder can increase engine wear as carbon particulates wash past the rings and into the oil and requires use of a diesel particulate filter to ensure that particulate matter is not introduced into the intake air. EGR systems can also add abrasive contaminants and increase engine oil acidity, which in turn can reduce engine longevity. As EGR systems are more appropriate when applied to new engine installations, this control technology will not be evaluated further for this application.

3.1.2.2 Steam Injection Systems and Emulsified Fuels

Both steam injection systems and emulsified fuels seek to reduce the combustion temperature by introducing water into the combustion process. Steam injection systems add water by injecting steam directly into the combustion zone. Emulsified fuel systems add water to the combustion process by incorporating water into the fuel spray droplets. The addition of water into the combustion process, through application of either of these control technologies, reduces the combustion temperature and thus reduces the formation of thermal NO_x. In general, these technologies have been demonstrated to reduce NO_x formation by 20 to 25 percent. However, introduction of water to the combustion zone may have long-term negative effects on engine function due to corrosion and reduced lubrication. As these technologies may be detrimental to engine function and would not be able to meet the presumptive 2.3 g/bhp-hr NO_x emissions standard, they will not be evaluated further in this analysis.

3.1.2.3 Injection Timing Retardation and Adjusted Cam Timing

Both injection timing retard (ITR) and adjusted cam timing technologies rely on adjustments to existing engine components to reduce NO_x emissions. ITR delays the ignition event until later in the power stroke, when the piston has begun to move downward. This adjustment increases the volume of the combustor chamber, resulting in a lower fuel to air ratio, which reduces the peak flame temperature and in turn reduces thermal NO_x formation. Adjusting cam timing increases the volume of combustion air trapped in the engine cylinder by opening the intake valve earlier in the engine cycle. Similarly to ITR, this reduces NO_x emissions by reducing the fuel to air ratio during combustion.

Modification of engine timing to reduce NO_x emissions typically results in increases in particulate matter, carbon monoxide, and hydrocarbon emissions. Given the potential negative side-effects, these control technologies will not be considered further in this analysis.

3.2 Fuel Switching

Given that the Rikers engines are old and would likely not have significant further operating life, and given the critical functions the engines serve for the Rikers correctional buildings, switching fuel from diesel fuel to natural gas would be inadvisable and furthermore technically infeasible, and therefore was eliminated as an option in this analysis.

3.3 System Averaging

The PLM engines are used for a very limited amount of time (65 hours per year). In addition, the Rikers boilers are also only used intermittently to supplement the cogeneration turbines during peak periods and when the cogeneration turbines are down for maintenance. Therefore system averaging was eliminated as an option in this analysis.

3.4 Summary of Feasible RACT Technologies and Strategies

Based on the discussion above concerning available control technologies and control strategies, the only NO_x reduction strategy that has been determined to be feasible and worthy of further evaluation to meet RACT for the Rikers engines is SCR. The economic feasibility of SCR is evaluated next to determine whether it is RACT in accordance with DAR-20.

4 NO_x RACT Economic Analysis

As required by DAR-20, this section presents an economic analysis of the only technically feasible control equipment or control strategy determined based on the findings presented in Section 3 of this report, that is, installation of SCR technology.

The following evaluation has been conducted in accordance with New York State's DAR-20. DAR-20 includes a "Table 1" worksheet outlining the procedure for the economic analysis. Worksheets for SCR examined in this analysis are included in Appendix A. Vendor budgetary quotes for supplying SCR systems on the engines are included in Appendix B.

The Capital Recovery Factor (CRF) used in this analysis is 0.13 based on a 10 year equipment life and a 5% interest rate. The cost effectiveness of the control option ("Cost of Controls per Ton Reduced") was determined in cost per ton of NO_x controlled on an annualized basis. The cost was then compared to the RACT upper limit of \$5,300 of annualized cost per ton of NO_x removed per DAR-20.

Budgetary cost quotes for the capital cost of SCR systems were obtained from three (3) vendors:

- AeriNO_x, Inc.
- Johnson Matthey
- PowerSecure, Inc.

The estimated cost information received from PowerSecure were significantly higher than those received from the other two vendors so it was disregarded.

The only difference in the cost estimates from the remaining two vendors was that $AeriNO_x$ provided estimates of commissioning costs and included engineering in its cost estimates. Both $AeriNO_x$ and Johnson Matthey excluded many items from the scope of supply (e.g., installation of new computer hardware, thermal insulation for the mixing pipe and catalyst housing, silencer, mounting hardware including mating flanges, gaskets, etc. (see Appendix B)), therefore it was assumed that the capital costs used in the economic analysis were conservative (low).

Both vendors provided <u>per-engine</u> capital cost estimates for the engines in groups of similar engines. Table 2 provides the groups of similar engines.

Table 2

Engine Groups and Emission Sources

Engine(s)	Emission Source No.(s)
Cat 3512 / 3516 1,110 / 1,150 KW	00010, 00011, 00018, 00019, 00020, 00022, 00024, 00025
Cat 3516 / 3508 Cummins 900 KW	00013, 00016, 00017
Cummins 800 KW	00014, 00015
Cat 3512 625 KW	00012

Annualized cost per ton of NO_x removed (\$/ton) were estimated for <u>each engine</u> in each of these four groups of engines for each of the two vendors, resulting in eight (8) separate per-engine \$/ton estimates to compare to the DAR-20 economic feasibility cost threshold of \$5,300/ton. If the cost exceeded this threshold then the control is not economically feasible and thus is not RACT.

The tables in Appendix A provide all of the details for the \$/ton estimates for each engine in each engine group. The major assumptions are summarized below.

Because neither vendor provided installation costs, direct and indirect installation costs were estimated using factors provided in the 6th and 7th Editions of EPA's Control Cost Manual. These factors are applied to the Purchased Equipment Cost (PEC) for each engine group. The PEC is estimated from the vendor-supplied Equipment Cost (EC) by applying percentages of the EC for instrumentation, sales tax and freight cost, all of which total to 14% of the EC.

Note that AeriNO_x provided an estimate for commissioning costs, and engineering costs were included in the quoted base price per unit. The commissioning costs provided by AeriNO_x were assumed to be costs associated with startup and the performance test. Johnson Matthey did not provide engineering and commissioning costs so these were estimated using the Cost Control Manual factors.

Estimates of annual operating costs were not available from the vendors so Control Cost Manual guidance was employed to estimate these costs. Because each engine is only expected to operate 65 hours/year under the PLM program these costs were insignificant.

Catalyst replacement cost and catalyst lifetime estimates were provided by CAT literature.

Electricity and reagent replacement costs were estimated using Control Cost Manual guidance in conjunction with estimates of urea flow rate, urea costs and cost of electricity.

Operating labor and maintenance costs were assumed to be insignificant given that each engine will operate infrequently during the year.

The NO_x tonnage reduction was calculated by multiplying the percent of NO_x reduced through the SCR system by the baseline annual emissions from the facility.

Table 3 provides a summary of the cost effectiveness estimates for each individual engine in each of the eight groups analyzed. The results show that the cost effectiveness of installing SCR on the engines ranges from about \$29,800 to \$68,000. These values far exceed the DAR-20 economic feasibility cost threshold of \$5,300/ton. Therefore, SCR is not considered RACT for any of the Rikers engines.

				Total Costs of Controls Per Ton of NO _x Reduced
			Emission	for <u>Each Engine</u> in Group
Group	Vendor	Engine(s)	Source No.(s)	(\$/ton)

2	AeriNO _x	Cat 3516 / 3508 Cummins 900 KW	00013, 00016, 00017	\$55,710
3	AeriNO _x	Cummins 800 KW	00014, 00015	\$68,031
4	AeriNO _x	Cat 3512 625 KW	00012	\$67,566
5	Johnson Matthey	Cat 3512 / 3516 1,110 / 1,150 KW	00010, 00011, 00018, 00019, 00020, 00022, 00024, 00025	\$30,379
6	Johnson Matthey	Cat 3516 / 3508 Cummins 900 KW	00013, 00016, 00017	\$51,972
7	Johnson Matthey	Cummins 800 KW	00014, 00015	\$65,168
8	Johnson Matthey	Cat 3512 625 KW	00012	\$57,744

Table 3 Summary of Economic Feasibility Calculations NYC DOC Rikers Island Engines

5 Summary and Conclusions

This RACT analysis was conducted pursuant to the requirements in 6 NYCRR Part 227-2. The 14 operational engines at Rikers are subject to the regulations in Part 227-2, specifically the requirements for stationary internal combustion engines. A RACT analysis was performed on the engines to meet Part 227-2 requirements. Potential control options were evaluated in accordance with New York State DAR-20 RACT analysis procedures.

Control technologies and control strategies evaluated pursuant to the NYSDEC RACT guidelines for the diesel engines included SCR, SNCR, exhaust gas recirculation, steam injection, emulsified fuels, timing retardation, adjusted cam timing, fuel switching, and system averaging. Of these technologies and strategies, only selective catalytic reduction was determined to be technically feasible for the Rikers engines.

SCR was evaluated for cost effectiveness using DAR-20 guidelines. The RACT analysis showed that SCR did not meet the DAR-20 economic feasibility cost threshold of \$5,300/ton NO_x controlled. Therefore, RACT for the fourteen Rikers engines is considered no control.

The revised emission limits for the 14 engines that are proposed for the Rikers Title V permit renewal are listed in Table 4. The current Title V limits remain valid unless the 2018 stack tests show that compliance with the current Title V limit for an engine cannot be demonstrated. In these cases the 2018 stack test result is proposed as the revised NO_x emission limit for that engine.

Stack testing will be performed once during the permit term to demonstrate compliance with the Table 4 limits.

5.1 Proposed Revisions to Title V Permit

The DOC proposes the following changes to the Rikers Title V permit based upon the NO_x RACT analysis presented in this document:

Conditions 102 – 115

Revise the NO_x emission limits to be consistent with the limits summarized in Table 4.

Condition 116

Remove this condition since Emission Source 00027 was mechanically unavailable for testing during the 2018 testing program.

Condition 98

Add Emission Source 00027.

Item 22.5

Revise the text as follows to reflect that Emission Source 00027 was not tested and the maximum emission rate measured in 2018 was 9.2 gm/bhp-hr:

"For the five (5) generators are not tested, the factor used is 9.2 gm/bhp-hr. Testing of these five generators will be performed at a later date based on DEC's approval and will not participate in PLM/CDRP until a variance/approval is sought."

VENDOR BUDGETARY QUOTES

Gretchen Master <gmaster@akrf.com>

RE: SCR Cost Inquiry

1 message

Loran Novacek <Inovacek@aerinox-inc.com> To: Gretchen Master <gmaster@akrf.com> Mon, Aug 6, 2018 at 12:13 PM

Hi Gretchen,

Attached is a budgetary quote for the engines listed below. I have grouped some of these together as the price at this point doesn't change drastically. For now I have assumed pricing per unit. However, if there are multiple units at the site there will likely be some costs savings due to some commonality of parts. Included is the hardware and commissioning labor. We can't do the installation since we are not licensed to act as the prime contractor but I have some contacts that can probably help with the installation if it gets to that point. For now, I would assume installation costs would be $\frac{1}{2} - 1x$ the cost of the hardware listed in our quote. Obviously, what makes this variable is site location, # of units, requirements/specs by the customer, is the units in a basement/ground level/top of the building, etc. Lots of factors will go into the overall cost of the installation but I think the $\frac{1}{2}-1x$ factor will give you an rough order of magnitude to base the budgetary to the customer on.

If you want to talk through our quote I would be happy to discuss details. If this seems to be financially attractive for the customer we will need to know some details on the engines (specs, qty, location) and then we can revise the quotes accordingly.

Regards,

Loran Novacek

Subject: SCR Cost Inquiry – Multiple Cat, Cummins Diesel Engines

Dear Ms. Master,

We are pleased to submit this budgetary proposal for an **AeriNOx™ Emissions Control Systems** designed to reduce NOx emissions from the subject unit listed below.

The **AeriNOx™ Emissions Systems** offered for this project are based on engine and emissions data provided by AKRF, Inc. The enclosed proposal details the price, scope of supply, warranty, commissioning and terms and conditions necessary to achieve the required emissions limits.

1. EXHAUST GAS DATA & EMISSION REQUIREMENTS

Engine Data:

OPERATING PARAMETER (at 100% Load)	CAT 3516*	CAT 3512*	CAT 3516, CAT 3508 Cummins*	Cummins*
Mfr Nominal Power @ 100% Load (kWe)	1100-1150	625	900	800
Expected Annual Hours of Operation (Hrs)	<200	<200	<200	<200
Fuel Type:	ULSD	ULSD	ULSD	ULSD
Exhaust Mass Flow Rate: (lb/hr)**	TBD	TBD	TBD	TBD
Exhaust Water Content (% by volume)**:	TBD	TBD	TBD	TBD
Exhaust O ₂ Content (% by volume)**:	TBD	TBD	TBD	TBD
Engine Outlet Temp**: (°F)	TBD (<850F)	TBD (<850F)	TBD (<850F)	TBD (<850F)

* Engine Data Sheet (To Be Provided by AKRF)

**Engine data required for accurate sizing

Emissions Guarantee and Warranty:

Emission*	Engine Outlet	Stack Limit	
NOx (as NO ₂)	8.3 g/bhp-hr	2.3 g/bhp-hr	

* based on 100% load for 1 hour

* based on a 500 hour guarantee from date of commissioning. Mechanical warranty is 12 months from commissioning or 18 months after delivery.

2. SCOPE OF SUPPLY

J

A. Engineering (Per Site)

- Drawings
- System flow diagram
- Control of the SCR system
-) Documentation

B. SCR Control System Components:

Includes the following major SCR components:

- (1) Urea/Air Injector and Mixing Duct
- (1) SCR Housing with SCR Elements
- (1) SCR PLC control cabinet
 - NOx sensor for closed-loop control
 - Urea/Air dosing control
-) (1) Air Compressor
- (1) x Urea storage tank (designed for ~40+ hours between fill with level switch. No insulation or heat tracing included (other sizes and options available upon request)

C. Commissioning of the SCR System

Estimated at 2 man-days for the commissioning of the emission control system (per unit) to meet the required emissions levels; includes estimated costs of travel and accommodations. We can provide qualified personnel to supervise installation at the rate of \$1,350 per man-day, plus travel expenses. Time and expenses will be billed per the time and material rates.

Schematic of a representative AeriNOx[™] Emission Control System.

3. PRICE

J

The given prices (shown below) for the SCR Emissions Control System are net prices, DDP to customer location in New York according to Incoterms 2010. All prices are in US dollars. Not included are duties or taxes. Payment terms are net 30. Based on the following payment terms:

- 50% of the order value upon initial order
- 40% of the order value for material ready to ship
- 10% of the order value after successful commissioning, not to exceed six (6) months after delivery.

	Cat 3516 1100/1150 kWe	Cat 3512 625 kWe	Cat 3516/3508 Cummins 900 kWe	Cummins 800 kWe
Base Price (per unit)	\$87,500	\$75,000	\$85,000	\$82,500
Commissioning (per unit)	\$11,500	\$11,500	\$11,500	\$11,500

4. SCHEDULING & DELIVERY

Delivery of the drawings and technical documents is approximately 6 weeks for release of preliminary engineering design after receipt of a purchase order. Ready for shipment of the hardware is approximately 12 weeks after approval of all technical details.

5. QUALITY STANDARD

The delivered components are according to ANSI and DIN standards. The electrical components are UL listed components. All drawings will be in both metric and English units. We reserve the right to adapt the technical design of the emission control system based on the results of the final engineering work, provided this does not impact the affect the guaranteed performance characteristics and is approved by the customer before production begins.

6. ASSUMPTIONS AND EXCEPTIONS:

Not included in the scope of supply:

- Load signal from the unit (4-20 mA)
- Unit running signal (digital dry contact, closed when unit is running)
- Installation of new hardware
- Structural and civil work necessary to complete the installation
- Aqueous Urea Solution
- Thermal insulation for the mixing pipe and catalyst housing (available as an option)
- Heat tracing of urea tank or urea lines (available as an option)
- Silencer for sound attenuation (available as an option)
- Provision for electricity and connection of the power supply to the enclosure
- Systems integration (design and engineering) with the building structure
- Platforms and other support structures
- Any 3rd party emission certification of stack test

Should you have any questions or comments, please do not hesitate to contact me.

Sincerely,

D

Marc Rost <Marc.Rost@jmusa.com> To: Gretchen Master <gmaster@akrf.com> Fri, Jul 27, 2018 at 8:34 AM

Hi Gretchen,

Based on the approximate 73% NOx reduction requirement, I provided an order of magnitude capital cost the SCR systems in your email below. However, we don't provide installation services and therefore I can't provide a budget price for that work. Due to the age of these engines, it is entirely possible that the diesel particulate could frequently foul the catalyst. This means the catalyst might need to be vacuumed and/or replaced more often than normal.

These prices are FCA points of manufacturer. They do not include utilities such as electricity, compressed air and urea, as well as the following items:

- All interconnecting piping, tubing and electrical cable
- Mounting hardware including mating flanges, gaskets, nuts, bolts and washers
- Silencer
- Ethernet connection through the internet for remote monitoring
- Expansion Joints
- Support steel
- Foundations
- Drainage
- Mechanical Installation
- Electrical Installation
- Commissioning
- Duct from engine outlet to mixing duct inlet including expansion joints
- Duct from SCR housing outlet to end of exhaust system
- Load bank for commissioning
- Third Party Testing
- Shipping and taxes (if applicable)
- Any product or service not specifically described in this proposal

Please let me know if you need anything else.

Thank you,

Marc Rost

From: Gretchen Master [mailto:gmaster@akrf.com] Sent: Monday, July 23, 2018 3:30 PM To: Marc Rost <<u>Marc.Rost@jmusa.com</u>> Subject: SCR Cost Inquiry

Hello Marc,

I work for AKRF, an environmental consulting firm, whom is providing environmental services to a client in New York. We are in need of a budgetary cost estimate for installation of SCR units for their 15 Diesel generators. The details of the engines are provided below:

(4) x 1100 KW CAT 3516 Engines (year 1988)

90K each x (4) = 360K

(1) x 625 KW CAT 3512 Engine (year 1992)

\$65K

(3) x 900 KW CAT 3516, CAT 3508 and Cummins Engines (Years 1992, 1998)

\$80K each x (3) = \$240K

(2) x 800 KW Cummins Engines (Year 1998)

\$80K each x (2) = \$160K

(5) x 1150 KW CAT 3512 Engines (Year 1990)

\$90K each x (5) = \$450K

We are evaluating technologies for these engines to control NOx emissions from a level of approximately 8.3 g/bhph to 2.3 g/bhph.

I would greatly appreciate if you could provide me an estimate for the installation of SCR units on these engines.

Please let me know if you have any questions.

1 Executive Summary

On May 22, 2018, the New York State Department of Environmental Conservation (NYSDEC) Region 2 office received an application for the renewal of the Rikers Island (Rikers) Air Title V Facility (Title V) permit (Permit ID: 2-6007-00259/00033). NYSDEC has requested that the New York City Department of Corrections (DOC) submit a revised Reasonably Available Control Technology (RACT) analysis for oxides of nitrogen (NO_x) for the eight (8) Rikers mid-size boilers that have source-specific NO_x RACT emission limits under a NO_x RACT variance). These limits were based on a NO_x RACT analysis dated December 2011 (See Condition 101 of the current Rikers Title V permit).

NYSDEC Region 2 also requested a revised analysis for all Rikers engines that have a NO_x RACT variance. A separate NO_x RACT analysis has been prepared for the engines and is being submitted under separate cover.

In the current Title V permit, the eight boilers are subject to a NO_x emissions cap of 11 tons/year - combined. With this Title V permit renewal, the boilers will no longer have a NO_x emissions cap.

This NO_x RACT analysis was prepared to respond to NYSDEC Region 2's request to update the NO_x RACT analysis for the eight boilers that are permitted with NO_x RACT variance emission limits, per 6 NYCRR Part 227-2.5(c) and NYSDEC Program Policy established in the Division of Air Resources (DAR) *Economic and Technical Analysis for Reasonably Available Control Technology (RACT) Networks*, (DAR-20), August 8, 2013.

The analysis was conducted pursuant to the NYSDEC RACT requirements of 6 NYCRR Part 227-2 for midsize boilers and DAR-20 guidelines.

The RACT analysis consists of identifying NO_x control technologies which meet feasibility standards for technical, economic, environmental, and energy performance. The following air pollution control technologies were considered in the RACT analysis for both technical and economic feasibility:

- Selective Catalytic Reduction (SCR);
- Selective Non-Catalytic Reduction (SNCR);
- Flue Gas Recirculation (FGR);
- Ultra-Low- NO_x Burners (ULNB);
- Steam Injection; and;
- Retrofits to the Existing Low- NO_x Burners

In addition to the above air pollution control technologies, the analysis included an evaluation of the use of fuel switching and the use of a system averaging plan pursuant to 6 NYCRR 227-2.5(c).

The analysis presented in this report demonstrates that the available air pollution control technologies do not meet RACT requirements for the reduction of NO_x emissions from the boilers. Consequently, adding air pollution control technology or retrofitting the existing boilers cannot be justified because these options are technically and/or economically infeasible.

As a result, RACT for the eight boilers is determined to be no control, as defined in NYSDEC DAR-20. The eight boilers, therefore, are considered to be in compliance with Part 227-2 at the existing NO_x variance limit of 0.12 lb/MMBtu in the current Title V permit based on the use of low NO_x burners that are installed in the boilers. Stack testing will be performed once during the permit term to demonstrate compliance with this limit.

2 Introduction

On May 22, 2018, the New York State Department of Environmental Conservation (NYSDEC) Region 2 office received an application for the renewal of the Rikers Island (Rikers) Air Title V Facility permit (Title V) permit (Permit ID: 2-6007-00259/00033). NYSDEC has requested that DOC submit a revised RACT analysis for NO_x for the Rikers eight (8) dual-fuel boilers that have source-specific NO_x RACT emission limits under a NO_x RACT variance based on a NO_x RACT analysis dated December 2011.

NYSDEC Region 2 also requested a revised analysis for all Rikers engines that have a NO_x RACT variance. A separate NO_x RACT analysis has been prepared for the engines and is being submitted under separate cover.

This NO_x RACT analysis is the evaluation of several emission control alternatives and the selection of RACT for the eight boilers at Rikers.

2.1 Source Background

Rikers operates eight wall-fired, water tube, field erected, 96 MMBtu/hr dual fuel fired boilers, which provide steam for the facility. The boilers currently operate on both No. 2 fuel oil and natural gas. Each of the boilers, which were originally built in the 1969 to 1971 time period, is rated to produce 70,000 lbs/hour of steam at a nominal pressure of 150 psig saturated. The boilers were originally designed to fire No. 6 fuel oil and in 1999, the burners on each of the boilers were upgraded to eliminate No. 6 fuel oil, and to include the combustion of natural gas as the primary fuel with No. 2 fuel oil as backup fuel. The new burners were also designed with low NO_x burner technology.

The eight boilers are grouped in the current Rikers Title V permit as shown in Table 1.

Emission Unit	Emission Sources *	Site ID Nos.	Process Nos.
U-00001	00001	6	001 (Gas)
	00002	7	002 (No. 2 oil)
	00003	8	
	00004	9	
U-00002	00005	2	003 (Gas)
	00006	3	004 (No. 2 oil)
U-00003	00007	4	005 (Gas)
	00008	5	006 (No. 2 oil)

Table 1 Sources of NOx Emissions

* - Each of the eight boilers are Keeler boilers, with the exception of Boiler No. 5 (Emission Source 00008) which is a Union Iron Works boiler.

The boilers tested in 2018 are shown in **bold** (see below).

2.1.1 Previous NO_x RACT Analysis

In December 2011, DOC submitted a NO_x RACT analysis for the eight boilers grouped under EU 00001, EU 00002, and EU 00003.¹ This analysis established the NO_x RACT variance limit of 0.12 lb/MMBtu for each of the eight boilers listed in Condition 101 of the current Rikers Title V permit.

¹ *Rikers Island – NO_x RACT Analysis, December, 2011*, attached to a letter from Ramon Li, P.E. (AKRF) to Thomas John (NYSDEC Region 2) dated December 28, 2011.

The December 2011 analysis referenced an August 1999 NO_x RACT analysis and compliance plan to select RACT for the eight boilers after the burner upgrade to low NO_x burners. That determination of RACT was based on technical feasibility, as well as environmental, economic, and energy impacts of the control technology. The technical feasibility of selective catalytic reduction (SCR), selective non-catalytic reduction (SNCR), using low NO_x burners with flue gas recirculation (FGR), and steam injection were considered. All but steam injection were evaluated further for environmental, economic, and energy impacts. Steam injection was considered technically infeasible.

An economic analysis was performed in 1999 for the SCR, SNCR, and FGR options and showed that total annualized equipment costs based on installed capital cost (and capital recovery factor) and operating and maintenance costs, divided by the tons of NO_x controlled each year, exceeded the DAR-20 benchmark value used to establish RACT, rendered the implementation of any additional control technology to be economically unjustifiable, and precluded any of them from being considered RACT. The total annualized control costs per boiler, NO_x emission reduction per boiler, and the resultant cost effectiveness in the 1999 analysis are presented in Table 2.

Control	Total Annualized Costs	NO _x Emission Reduction Per Boiler (tons)	Cost Effectiveness (\$/ton)
SCR	\$1,143,299	33	\$34,859
SNCR	\$348,520	18	\$19,735
FGR	\$130,059	9	\$15,435

Table 2

August 1999 Economic Analysis

The 2011 NOx RACT analysis evaluated the economic feasibility of the add-on control technologies based on the curtailed operation of the boilers pursuant to the applicable caps reducing the NO_x emissions from 403.77 tons/year to 11 tons/year. In the 2011 RACT analysis, only FGR (which was previously determined to be the lowest cost control technology option) was re-evaluated based on technologies current at the time and current vendor information. Table 3 presents the total annualized cost, NOx emission reduction and the resultant cost effectiveness in the December 2011 analysis.

Table 3

December 2011 Economic Analysis

Control	Total Annualized Costs	NO _x Emission Reduction (tons)	Cost Effectiveness (\$/ton)
FGR	\$254,200	3.2	\$78,700

2.1.2 2020 Updated NO_x RACT Analysis

Pursuant to the Title V permit requirement to test the boilers during the permit term, Environmental Laboratories, Inc. (ELI) tested three of the eight Rikers boilers during the period September 24 through

October 1, 2018.² Due to the identical designs of the eight boilers, representative testing was performed for natural gas and oil-fired operation. Boiler No. 5 was not in service at the time and was therefore not considered for testing.

The results of the performance testing are provided in Table 4. The maximum achievable firing rate for all boilers is currently capped at 60% by the facility (high load). Testing was performed at this high load, as well as at mid load (40%) and low load (20%) conditions. Table 1 shows that the measured NO_x emission levels for all tests were in compliance with the alternative NO_x RACT level of 0.12 lbs/MMBtu found in Condition 101 of the current Rikers Title V permit.

For the purposes of this RACT determination, a baseline condition for compliance was established using the maximum NO_x emission rate measured during the 2018 emissions test, which was 0.100 lb/MMBtu. This RACT analysis is conducted on technologies that can bring the baseline emissions down to, or below the Part 227-2 presumptive NO_x RACT level of 0.08 lb/MMBtu for distillate oil/gas operations for mid-size boilers such as those in operation at Rikers. Use of the maximum emission rate results in a required 20% reduction over the baseline condition to reach the presumptive NO_x RACT level of 0.08 lb/MMBtu. Using the maximum measured NO_x value results in the largest percentage reduction, which results in the largest NO_x tonnage reduction in the cost effectiveness calculation, thereby producing the lowest (most conservative) (most NYSDEC.

2.2 RACT Requirements and Process

New York State's 6 NYCRR Part 200 defines RACT as the: "Lowest emission limit that a particular source is capable of meeting by application of control technology that is reasonably available, considering technological and economic feasibility." New York State has issued a guideline document, DAR-20, for conducting RACT analyses.

The provisions of Part 227-2 apply to major stationary sources of NO_x for different types of combustion equipment burning different fuels.

RACT requirements applicable to a particular emission source may fall into one of two categories - presumptive RACT limits or case-by-case RACT determinations. Presumptive RACT limits are category-wide requirements and are based on capabilities that are general to an emission source category. However, for some categories of emission sources, presumptive RACT limits may not be attainable at every individual emission source. Case-by-case RACT determinations consider the technological and economic circumstances of the individual emission source.

Pursuant to 6 NYCRR Part 227-2.2(b)(4), each of the eight Rikers boilers is classified as a "mid-size boiler" because the maximum heat input capacity of each boiler is greater than 25 MMBtu/hr and equal to or less than 100 MMBtu/hr.

Specific requirements for mid-size boilers are prescribed at 6 NYCRR 227-2.4(c)(1)(ii). The Rikers boilers must comply with a NO_x emission limit of 0.08 lb/MMBtu (because they are dual fuel-fired (distillate oil/gas) boilers), or a limit based on a case-by-case RACT determination.

According to 6 NYCRR 227-2.5(c), for those sources that demonstrate that the applicable presumptive RACT emission limit in section 227-2.4 is not economically or technically feasible, the owner or operator can request the NYSDEC to set a higher emission source specific emission limit.

DOC has elected to perform a RACT analysis to demonstrate compliance with Part 227-2 for the eight boilers per Part 227-2.5(c). The RACT analysis consists of identifying NO_x control technologies which meet requirements for technical and economic feasibility.

The selection of RACT for the NO_x sources described herein was made using the "top-down" approach for evaluating control technologies. The "top-down" analysis method stipulates that available control technologies first be assessed for technical feasibility, including both demonstrated and transferable technologies with practical potential application to the source. Options which are considered technically feasible are then ranked for control effectiveness in descending order.

Each feasible technology must undergo an economic analysis, consisting of an evaluation of the lowest of actual budgetary bids from vendors. A total annualized equipment cost based on the installed capital cost (and capital recovery factor) and operations and maintenance costs must be determined, then divided by the tons of NO_x controlled each year to determine the technology's cost effectiveness in dollars per ton NO_x reduced (1000, Per DAR-20, a source will not be required to implement any emission control or strategy if the resultant cost exceeds the 5300/ton³ cost threshold that defines economic feasibility. This RACT analysis follows these procedures.

After the technical feasibility analyses have been completed, the overall impact of each alternative is either determined to be "reasonably available" and selected as RACT or is rejected due to "unreasonable" economic impacts. The most stringent technology not rejected is designated as RACT for the source.

As a result of this analysis, DOC is requesting that the NYSDEC set a higher emission source specific emission limit than the 0.08 lb/MMBtu level prescribed at 6 NYCRR 227-2.4(c)(1)(ii).

³ RACT cost threshold was established as \$3,000/ton in 1994 dollars. The NYSDEC uses the Bureau of Labor Statistics CPI Inflation Calculator to adjust this \$3,000 economic feasibility threshold over time for inflation (http://www.bls.gov/data/inflation_calculator.htm).

3 Available Control Technologies and Strategies

During combustion, NO_x is primarily formed in two ways: fuel NO_x and thermal NO_x .

Thermal NO_x refers to the high temperature reaction of atmospheric nitrogen and oxygen from the combustion air. The reaction rate is highly dependent on temperature and thus the thermal environment in the flame zone primarily controls thermal NO_x formation. Thermal NO_x is dependent to a lesser extent on the availability of oxygen in the flame zone.

Fuel NO_x is formed by the oxidation of organic bound nitrogen in the fuel during combustion. Fuel NO_x formation is less sensitive to temperature compared to thermal NO_x, but it is strongly influenced by oxygen availability. Fuel NO_x formation is also directly related to fuel nitrogen content. Both fuel NO_x and thermal NO_x mechanisms are important with the combustion of fuel oil. Natural gas, however, contains no fuel bound nitrogen and thus NO_x is formed only by the thermal NO_x mechanism.

A third form of NO_x, prompt NO_x, is formed during the oxidation of molecular nitrogen present in the combustion air stream in areas of the flame envelope that are "fuel rich". Under these fuel rich conditions, particularly when stoichiometry is under 0.60, both hydrogen cyanide (HCN) and ammonia (NH3) can be formed through the rapid reaction of CH radicals with N2 to form HCN and N. Below a stoichiometry of 0.50, almost all NO_x formed is prompt NO_x. Although prompt NO_x is temperature sensitive, the temperature is not as great as with thermal NO_x. The rate of formation of prompt NO_x is extremely rapid, being complete in approximately 1 millisecond. Under fuel rich conditions and a temperature of just 2400°F, 20 ppm of prompt NO_x still remains. In most cases, prompt NO_x emissions are negligible.

NO_x formation can be limited by lowering combustion temperature and staging combustion (a reducing atmosphere followed by an oxidizing atmosphere).

 NO_x emission controls are divided into two categories: post combustion emission reduction and in-furnace combustion control. Post combustion NO_x controls reduce a portion of the NO_x exiting the combustion zone to nitrogen. In-furnace formation control processes reduce the quantity of NO_x formed during the combustion process.

The focus of this section will be on the identification of available control technologies that are technologically feasible as RACT for the boilers at Rikers Island. Available control options are those which have a practical application for the pollutants and the process under consideration and must be sufficient to meet the Part 227-2 limits. Control technologies to be investigated for the reduction of NO_x from the boilers include: FGR, ULNBs, steam injection, SNCR, and SCR.

One of the important factors which impacts the installation of additional controls at the facility is the age of the facility, extremely limited available space and difficult location. Due to these constraints, any construction work at the facility is extremely difficult. The uncertainty associated with the capacities of the existing roof systems to carry any off gas NO_x reduction systems installed on the roof may also preclude the installation of off gas NO_x control systems.

In addition to control technologies listed above, this section evaluates the strategies of fuel switching and the use of a system averaging plan per 6 NYCRR 227-2.5(c) because DOC is requesting that NYSDEC set emission limits for the eight boilers that are higher than the presumptive NO_x RACT levels for mid-size boilers prescribed in 227-2.4.

3.1 Potentially Feasible Control Technologies

Descriptions of potentially feasible control technologies, are provided below.

3.1.1 Selective Catalytic Reduction (SCR)

SCR is a post-combustion NO_x control technology involving the injection of ammonia (NH3) or urea into the exhaust gas stream upstream of a specialized catalyst module, promoting conversion of NO_x to molecular nitrogen. The catalyst bed is used to lower the activation energy required for NO_x decomposition. The major components of an SCR system include an ammonia storage tank, an injection grid (system of nozzles that spray NH3 into the exhaust gas ductwork), a structured, fixed-bed catalyst module, and electronic controls. In the SCR process, NH3, usually diluted with air or steam, is injected through a grid system into the exhaust gas upstream of the catalyst bed. On the catalyst surface, the NH3 reacts with NO_x to form molecular nitrogen and water. The basic reactions are:

 $4NH3 + 4NO + O2 \rightarrow 4N2 + 6H2O$ $8NH3 + 6NO2 \rightarrow 7N2 + 12H2O$ $NH_3 + O_2 \rightarrow NO_X + H_2O$

The first and second equations reflect the NO_x reduction reaction. The third equation reflects the formation of NO_x by a side reaction in an SCR if the actual temperature exceeds the optimum reaction temperature. At these high temperatures, NO_x emissions actually increase and SCR is counter-productive. The reaction mechanism involved in the process is very temperature-sensitive and can be used to reduce NO_x only within a narrow temperature window.

The above discussion illustrates how temperature is a key SCR performance parameter. The NO_x reduction reaction is effective only within a given temperature range. In an SCR system, the optimum temperature depends two reaction components: the type of catalyst and the flue gas composition. According to EPA's *Control Cost Manual*,⁴ for the majority of commercial catalysts (metal oxides), the operating temperatures for the SCR process range from 480°F to 800°F. The rate of NO_x removal increases with temperature up to a maximum between 700°F and 750°F. As the temperature increases above 750°F, the reaction rate and resulting NO_x removal efficiency begin to decrease. The normal NO_x control efficiency range for SCR is 70% to 90%. However, with low NO_x burners, such a reduction is problematic.

3.1.2 Selective Non-Catalytic Reduction (SNCR)

SNCR is a post-combustion NO_x control technology in which a reagent (anhydrous NH3 or urea) is injected into the flue gas stream to react chemically with NO_x , forming elemental nitrogen and water. The relevant reaction is:

$$2\text{NO} + \text{CO}(\text{NH2})2 + 1/2 \text{ O2} \rightarrow 2\text{N2} + \text{CO2} + 2 \text{ H2O}$$

The success of this process in reducing NO_x emissions is highly dependent on the ability to achieve uniform mixing of the reagent into the flue gas. Without the use of a catalyst, the reaction requires a high temperature range to obtain activation energy. This must occur within a zone of the exhaust stream where the flue gas temperature is within a narrow range, typically from 1,600°F to 2,100°F. In order to achieve the necessary mixing and reaction, the residence time of the flue gas within this temperature window should be at least 0.5 to 1.0 second. The consequences of operating outside the optimum temperature range are severe. Above the upper end of the temperature range, the reagent will be converted to NO_x and the NO_x control efficiency decreases rapidly. Below the lower end of the temperature range, the

⁴ EPA Air Pollution Control Cost Manual, Seventh Edition, available at <u>https://www.epa.gov/economic-and-cost-analysis-air-pollution-regulations/cost-reports-and-guidance-air-pollution</u>

reagent will not react with the NO_x and the NH3 discharge from the stack (known as "ammonia slip") will be very high. The normal NO_x control efficiency range for SNCR is 50% to 70%.

3.1.3 Flue Gas Recirculation (FGR)

FGR uses flue gas as an inert material to reduce flame temperatures. In a typical flue gas recirculation system, flue gas is collected from the heater or stack and returned to the burner via a duct and blower. A fan (blower) is needed to withdraw the required amount of flue gas. This system is usually called Flue Gas Recirculation (FGR). In some cases, this type of system is referred to as "External Flue Gas Recirculation (EFGR)" or "Forced Flue Gas Recirculation". This differentiation is made because sometimes the flue gas for FGR is taken from the flue gas flow upstream of the stack using the forced draft (FD) fan instead of a separate FGR fan. This system is called "Induced Flue Gas Recirculation (IFGR)". A separate FGR fan avoids the mixing of the combustion air and the flue gas upstream of the FD fan, thus protecting the life of the fan. The FGR fan generally will operate at a temperature above the acid dew point, and thus exposure to sulfurous acid is minimized. In either system, the flue gas reduces the oxygen content of the "combustion air" (air + flue gas) in the burner. The addition of flue gas reduces the oxygen content of the "combustion air" (air + flue gas) in the burner. The lower oxygen level in the combustion acontrols, the normal NO_x control efficiency range for FGR is 30% to 50%. When coupled with low- NO_x burners (LNB) the control efficiency increases to 50%-72%.

3.1.4 Steam Injection System

By injecting water or steam into the flame, flame temperatures are reduced, thereby lowering thermal NO_x formation and overall NO_x levels. Water or steam injection can reduce NO_x up to 75% (when firing natural gas) and can result in lower reductions when firing oil. There is a practical limit to the amount of water or steam that can be injected into the flame before condensation problems are experienced. Additionally, under normal operating conditions, water/steam injection can result in a 3-10% boiler efficiency loss. Water or steam injection can be used in conjunction with other NO_x control methods such as burner modifications or flue gas recirculation.

There are several adverse factors that arise when evaluating the use of steam injection.

- The effect of the steam injection on the flame scanner performance must be reviewed with the flame scanner supplier. There is a possibility that the steam injection could affect the flame scanner's ability to detect the flame.
- The additional moisture from the steam injection will cause a reduction in boiler efficiency.
- Under certain circumstances moisture from the steam can condense in the rear of the boiler causing corrosion problems.
- The long-term and /or corrosive effects and possible tube life wastage that could be contributed to excessive moisture.

Considering the loss in efficiency and the lack of manufacturer guarantees for low NO_x emissions from the burners while firing fuel oil, steam injection is determined to be a technically infeasible control technology for RACT for the facility's boilers.

3.1.5 Ultra-Low-NO_x Burners

ULNBs may incorporate a variety of techniques including induced flue gas recirculation, steam injection, or a combination of techniques. These burners combine the benefits of flue gas recirculation and low-NO_x burner control technologies. Rather than a system of fans and blowers (like FGR), the burner is designed to recirculate hot, oxygen depleted flue gas from the flame or firebox back into the combustion zone. This

leads to a reduction in the average oxygen concentration in the flame without reducing the flame temperature below temperatures necessary for optimal combustion efficiency. Reduced oxygen concentrations in the flame have a strong impact on fuel NO_x so ULNBs are an effective NO_x control for boilers firing fuel oil. The estimated NO_x control efficiency for ULNBs in high temperature applications is 50%. Newer designs have yielded efficiencies of between 75%-85%. When coupled with selective catalytic reduction, efficiencies in the range of 85%-97% can be obtained.

The existing boilers already have low NO_x burners installed. Replacing the low NO_x burners with ultra-low NO_x burners would require replacing both the burners in each of the eight boilers and installing flue gas recirculation in order to stage the flue to create a longer flame length needed to achieve the low emission levels required while burning fuel oil. While utilizing ULNBs with FGR is considered a technically feasible control technology, vendors did not want to provide even preliminary cost estimates for this option since it was determined to be a very cost prohibitive alternative for the boiler configuration at this facility. As presented below, adding FGR alone is already a costly alternative; therefore, while technically feasible, this technology was not considered further.

3.1.6 Retrofits to the Existing Low NO_x Burners

Options to reduce the NO_x emissions by modifying the existing low NO_x burners were also analyzed. The retrofits in addition to derating the boilers would allow NO_x emissions to meet the RACT limits while the boilers operated on natural gas, however, the manufacturer would not guarantee a fuel oil limit that could meet the NO_x RACT limits; therefore, this technology was not considered further.

3.2 Fuel Switching

The Rikers boilers can operate on natural gas alone, but as shown in Table 1 the boilers cannot meet the "gas-only" presumptive NO_x RACT limit of 0.05 lb/MMBtu level prescribed at 6 NYCRR 227-2.4(c)(1)(ii). Therefore, this strategy was eliminated from consideration.

3.3 System Averaging

The Rikers boilers are only used intermittently to supplement the cogeneration turbines during peak periods and when the cogeneration turbines are down for maintenance. In addition, the PLM engines are only used for a very limited amount of time (65 hours per year). Therefore, system averaging was eliminated as an option in this analysis.

3.4 Summary of Feasible RACT Technologies and Strategies

The next step in the analysis is to perform a "top-down" economic evaluation of the NO_x reduction strategies determined as technically feasible. Under this approach, technically feasible alternatives with the highest control level are evaluated first. If the "top-level" alternatives are eliminated from consideration as RACT based on adverse economic, energy, or environmental impacts, then other technically feasible alternatives are evaluated in the order of decreasing control level. The NO_x reduction strategies that have been determined technically feasible and worthy of further evaluation to meet RACT for the Rikers Island boilers are listed below:

- SCR;
- SNCR; and
- FGR

The steam injection system and retrofits to the existing burners were not considered technically feasible NO_x reduction strategies.

SCR, SNCR, and FGR were evaluated in the August 1999 NO_x RACT analysis and determined not to be RACT due to the excessive cost per ton of NO_x reduced for each control technology. The costs for SCR and SNCR today would be much higher than in 1999, and the NO_x reductions would be smaller, thus the cost effectiveness estimates using current information would be higher than those used in 1999. FGR was reevaluated in the December 2011 NO_x RACT analysis and determined not to be RACT due to the excessive cost per ton of NO_x reduced.

For the purposes of this NO_x RACT analysis for compliance with the 6 NYCRR 227-2.4(c)(1)(ii) presumptive NO_x RACT limits, FGR was re-evaluated based on current technologies and vendor information in accordance with DAR-20 procedures and NYSDEC guidance to determine if this control technology could now be considered RACT.

4 NO_x RACT Economic Analysis

As required by DAR-20, this section presents an economic analysis of the only technically feasible control equipment or control strategy determined based on the findings presented in Section 3 of this report, that is, retrofit each boiler with FGR.

The following evaluation has been conducted in accordance with New York State's DAR-20. DAR-20 includes a "Table 1" worksheet outlining the procedure for the economic analysis. A worksheet for retrofitting the boilers with FGR is provided in Appendix A.

For the December 2011 NO_x RACT analysis, a quote for the capital cost of FGR was obtained from the burner manufacturer, Coen Company, Inc. Back then, an attempt was made to obtain additional vendor information; however, other vendors, referred AKRF back to the original burner manufacturer indicating that COEN would be able to provide the most accurate price.

For this analysis, an updated FGR capital cost estimate was obtained from Coen. The Coen budgetary cost quote is provided in Appendix B and includes costs to retrofit all eight boilers.

The Capital Recovery Factor (CRF) used in this analysis is 0.13 based on a 10 year equipment life and a 5% interest rate.

The cost effectiveness of the control option ("Cost of Controls per Ton Reduced") was determined in cost per ton of NO_x controlled on an annualized basis. The cost was then compared to the RACT upper limit of \$5,300 of annualized cost per ton of NO_x removed per DAR-20. If the cost exceeds this threshold then the control is not economically feasible and thus is not RACT.

The table in Appendix A provide all of the details of the \$/ton estimate. The major assumptions are summarized below.

Because COEN did not provide installation costs in its quote, direct and indirect installation costs were estimated using factors provided in the 6th and 7th Editions of the EPA *Control Cost Manual*. These factors are applied to the Purchased Equipment Cost (PEC) of the FGR equipment. The PEC is estimated from the vendor-supplied Equipment Cost (EC) by applying percentages of the EC for instrumentation, sales tax and freight cost, all of which total to 14% of the EC.

Note that Coen included engineering and other related costs in its quote so these were not included in the calculation of indirect installation costs.

Estimates of annual operating costs were not available from COEN; therefore, Control Cost Manual guidance was employed to estimate these costs. The electricity cost was estimated using EPA published factors⁵.

The NO_x tonnage reduction was calculated by multiplying the percent of NO_x reduced by the baseline annual emissions from the facility. The percent reduction was calculated to be 20% based upon what reduction, from the 2018 measured NO_x levels, would be required to meet the presumptive NO_x RACT limit of 0.08 lb/MMBtu, as discussed above.

The cost effectiveness calculation provided in Appendix A shows that the cost effectiveness of retrofitting the boilers with FGR is approximately \$7,344/ton. This value exceeds the DAR-20 economic feasibility cost threshold of \$5,300/ton. Therefore, FGR is not considered RACT for the Rikers boilers.

⁵ Alternative Control Techniques Document – NOx Emissions from Industrial/Commercial/Institutional (ICI) Boilers, U.S. EPA Emission Standards Division, 1994, Publication No EPA-453/R-94-022.

5 Summary and Conclusions

This RACT analysis was conducted pursuant to the requirements in 6 NYCRR Part 227-2. The eight boilers at Rikers are subject to the regulations in Part 227-2, specifically the requirements for mid-size boilers. A RACT analysis was performed on the boilers to meet Part 227-2 requirements. Potential control options were evaluated in accordance with New York State DAR-20 RACT analysis procedures.

Control technologies and control strategies evaluated pursuant to the NYSDEC RACT guidelines for the boilers included SCR, SNCR, FGR, ULNBs, steam injection, retrofits to the existing low NO_x burners, fuel switching, and system averaging.

First, a feasibility analysis was performed to determine which technologies were capable of controlling NO_x emissions from the boilers. This analysis eliminated steam injection, burner retrofits, and the additional of ultra-low NO_x burners from further evaluation because they were determined to be technologically infeasible. Fuel switching and system averaging were determined to be irrelevant.

The remaining control strategies and technologies were as follows:

- SCR;
- SNCR;
- FGR

These strategies and technologies were evaluated for their cost effectiveness, using New York State's DAR-20 guidelines. The RACT analysis showed that based on economic considerations, all of the strategies and technologies exceed the RACT guideline of \$5,300/ton NO_x controlled for the boilers. Therefore, RACT for the boilers is determined to be no control, and as a result the current Title V permit limit of 0.12 lb/MMBtu should remain as the RACT limit based on the use of the low- NO_x burners that are currently installed on the boilers.

Stack testing will be performed once during the permit term to demonstrate compliance with the recommended 0.12 lb/MMBtu limit.

AKRF, Inc. 440 Park Ave South, 7th Floor New York, NY 10016

Attention: Ms. Gretchen Master

Reference: Rikers Island East Elmhurst, NY Meet RACT rule for Boilers #2, 3, 4, 5, 6, 7, 8 & 9 JZ SO #65202.1 & 65202.3 John Zink Proposal No: 201807-95792-A

Dear Gretchen:

Based upon the burner design specification presented in Section 2, the John Zink Company, LLC is pleased to offer the enclosed budget proposal in response to your inquiry for reducing current NOx levels to meet the 2014 RACT rules.

1.0 Overview

John Zink has been requested by AKRF, Inc. for Rikers Island to supply equipment to upgrade (8) existing Keeler Boilers (#2, 3, 4, 5, 6, 7, 8 & 9) to meet the NY RACT rule for 2014. Based on current stack NOx test results of 0.07 lbs/mmBtu on NG and 0.113 lbs/mmBtu on #2 oil, John Zink has reviewed the data and will meet the new RACT NOx levels with a boiler derate and FGR. This will allow the boilers to maintain the existing FD fans and motors. John Zink will be supplying new FGR Inlet Box packages to be retrofitted to the existing FD fan. John Zink will achieve NOx on NG firing of 0.05 lbs/mmBtu and 0.08 lbs/mmBtu on #2 Oil firing with 0.02% fuel bound nitrogen (FBN). The equipment will be shipped loose for installation by the Installing Contractor.

2.0 John Zink's Detailed Scope

2.1 Burner Equipment

The following is included in the Burner Equipment Scope. See below for a detailed description of <u>each item on a per boiler basis</u>

- (1) FD Fan Inlet Silencer with combustion air flow meter loose
- (1) FGR Inlet Box package loose
- (1) FGR damper, manual loose
- (2) Sets of Variflame NG Pokers

The following is NOT included in the Burner Equipment Scope.

- FGR ducting with supports, expansion joints, connectors, insulation, etc from the stack to the FGR Inlet Box connection.
- Existing FD fan inlet modifications to accept the new FGR inlet box. John Zink will supply drawings as required.
- FGR inlet box supports to ground level.
- Upgrades to BMS system including hardware/software and documentation for FGR inputs
- Upgrades to Combustion Controls including hardware/software and documentation for FGR control
- Removal, disposal, reinstallation of existing equipment and installation of new equipment
- Miscellaneous wire, conduit, tubing, etc best supplied by the Installing Contractor.
- Insulation or personnel protection
- Startup Service

FGR Inlet Box Package (Qty; 1)

John Zink will be supplying (1) FGR Inlet Box package to be mounted to the FD fan inlet. The FGR Inlet Box package includes:

-FGR Inlet box with 18" D x ~12' L FGR connection piece

-FGR Fresh Air damper mounted to the Inlet Box inlet.

-FGR Fresh Air damper Type K pneumatic actuator or equal and I/P positioner -Standard prep, primed and painted

-Inlet Silencer with piezometer tube to be mounted to the FGR Fresh Air Damper. Sized for 85 dBA @ 3-5 ft in front of the inlet. The sound calculations assume a free field environment. Shipped loose.

Combustion Air Flow Transmitter (Qty: 1)

John Zink will supply (1) loose DP transmitter with manifold valve to connect to the piezometer in the field.

FGR Damper (Qty: 1)

John Zink to supply manual 18" FGR damper loose for field installation by the Installing Contractor.

Variflame NG Pokers (Qty: 12)

Each existing Variflame burner has (6) NG pokers that will need to be changed. This will allow the proper drilling pattern with the introduction of the FGR for the lowest NOx and best combustion performance for the derated capacity.

2.2 Paint and Finish

John Zink surface preparation and painting will be as follows: **Product**

- Acrylic Emulsion primer/finish, no topcoat
- Sherwin-Williams DTM Acrylic or equivalent
- SW data sheet 1.21

Surface Preparation

SSPC-SP6

Dry Film Thickness (S-W, other mfg see product sheet)

• 5.0 - 6.0 mils

Performance

• Consult the manufacturer's product information sheet

Technique

• Consult the manufacturer's application bulletin and JZ 9001-OPS-MFG-58

Inspection

• Consult JZ 9001-OPS-QC-61

3.0 Design Conditions

3.1 Boiler Information

Number of boilers Number of burners per boiler	
Boiler manufacturer	Keeler / UIW
Boiler designation	Field Erected
Furnace dimensions: Width inside water tubes feet	17.875'
Average Height feet	18.0'
Length feet	12.23'
Length for flame feet	12.0'
Steam capacity pph – Derate based on 680/550 deg F FGR	56,000 / 58,100
Design boiler HHV BTU input NG /#2 mmbtu/hr w/680/550 F FGR	76.84 / 72.00
	79.72 / 74.70
Boiler furnace pressure "w.c. w/14% FGR	0.0
Steam pressure psig	150
Steam temperature °F	SAT
Boiler Feedwater temperature °F	
Boiler Efficiency, %	72.9 / 77.8
	(assumed)
Minimum boiler stack height feet	50
Location	Indoor
Economizer used	

3.2 Electrical & Utilities

Fan electrical characteristics (v/hz/ph)	460/60/3
Panel electrical characteristics (v/hz/ph)	
Instrument air supply (clean, dry, and oil-free) psig	90

3.3 <u>Codes</u>

Area classification	Non-hazardous
NEMA class rating	
Code requirements	
Piping requirements	
Individual electrical components will carry	

3.4 Combustion Air

Combustion air temperature °F	80
FGR temperature 🔶	680
Air humidity (%)	
Air density at standard conditions (lbm/ft ³)	0.075
Design combustion air density (lbm/ft ³)	
Mix Density of combustion air/FGR 680 / 550 deg F	0.0634 / 0.0656
Mix temperature of combustion air / FGR °F 680 / 550 deg	157.5 / 136.7
Plant elevation (FASL)	70
Combustion air pre-heat	No

3.5 Fuels

Main fuel	Natural Gas
Ignition fuel	Natural Gas

NG Analysis:

Higher Heating Value btu/scf	1,000
Specific Gravity	0.0599
Density (#/ft3)	0.0457
Molecular weight	17.35

<u>#2 Fuel Oil</u>

High Heat Value	19,500 btu/lb
Nitrogen percent by weight	0.02
Sulfur percent by weight	0.05
Ash percent by weight	0.01 assumed
BS&W percent by weight	0.01 assumed
Conradson Carbon Residue, percent	0.35 assumed
Pressure required at Coen train inlet, oil	175 psig
Pressure required at Coen train inlet, atomizing steam	150 psig

4.0 Burner Performance and Guarantees

4.1 Burner Performance

Burner pressure drop "w.c. NG / #2 w/680 /550 F FGR	
Burner excess air @ 100% MCR FGR percent (%) 680 / 550 F FGR Boiler turndown based on steam output NG supply pressure at train inlet psig NG supply pressure at burner header inlet, psig Pilot gas pressure required at the train inlet psig Pilot gas pressure at ignitor, psig #2 Oil supply pressure at the gun connection, psig	15 14 / 13 8:1 / 6:1 14.5 7.0 14.5 0.75
Atomizing steam pressure at the gun connection, psig	

4.2 <u>Burner Guarantees</u>

A. The following performance guarantees will be extended from twenty-five (25) to one hundred (100) percent of boiler load, provided that the system is operated at steady state conditions, in accordance with the Burner Design Basis and Specifications in Section 2:

Fuel:

Natural Gas / #2 Oíl

NOx #/mmbtu	0.05 / 0.08
SOx #/mmbtu	
Total Particulates #/mmbtu	0.007 / 0.05
CO #/mmbtu	0.037 / 0.039
VOC #/mmbtu	0.0042 / 0.0048

- 'ppm' emissions are referenced to 3% dry stack O2.

- All emissions are relevant to the fuel(s) specified in this proposal only, based on HHV.
- All information provided in the Burner Design Basis and Specifications is preliminary only and is subject to change after the detailed Engineering stage on the contract is completed.
- Particulate matter includes unburnt compounds derived from the fuel and excludes any ash present in the fuel and any inorganic or non-combustible material present in the ambient air used for combustion.

- SOx on NG are based on a maximum of 1 micron/scf of fuel.

- B. The burner(s) flame will have no deleterious impingement over the entire burner turndown range as per the American Boiler Manufacturers Association Definition: "Flame impingement is defined as the condition which exists when the flame resulting from the combustion of the fuel comes into contact with any interior surface of the furnace in such a way as to result in localized incomplete combustion of the fuel and such condition manifests itself in the formation of hard carbonaceous deposits at the contact location. Flame impingement is a condition of firing a fuel which may cause failure and/or excessive maintenance of combustion chamber wall surfaces".
- C. All performance specifications stated throughout this proposal are intended to show probable operating results only which cannot be guaranteed except as expressly stated in the guarantee clause A).

- D. Testing for performance guarantees shall be run within thirty (30) days after the equipment has been installed and operated. Others shall furnish all operating personnel and equipment for such tests. A John Zink trained service engineer shall fine tune the burner as required and observe the operation of auxiliary equipment to assure that performance guarantees will be met, prior to testing, unless John Zink, in its sole discretion, waives this requirement because it deems on-site tuning to be a safety risk or commercially or legally unreasonable. John Zink's representative will have access to the records at all times and the tests will be conducted in a manner to ensure that the specified performance conditions are being maintained. For oil fired systems, others shall take samples of the fuel oil during the performance test and have its nitrogen content measured by an independent test laboratory. John Zink will be supplied a complete copy of all test results and data.
- E. The equipment shall be considered accepted if tests show that the guarantees have been fulfilled, or if others fail to have the equipment tested within the specified period. In case of the failure to meet the guarantees, John Zink reserves the right to change or replace, on a straight time basis, the equipment furnished so that the guaranteed performance will be obtained.

5.0 Budget Pricing

John Zink has provided a budget price relative to the scope of supply and the stated prices are valid for estimating purposes only. Any firm offer, or binding quotation will be the subject of a formal proposal at a future date.

Note: The only difference will be a smaller FGR connection and FGR damper from 18 to 16" D.

Price Validity: This is a budgetary proposal and is intended only as an estimate to facilitate your planning processes and does not constitute a commitment or offer to sell goods or services at the prices and terms referenced herein.

Quoted prices are ex-works (EXW) (Incoterms 2010), exclusive of freight and any applicable sales, use or excise taxes.

6.0 Terms and Conditions

Subject to credit approval, progress payments will be required according to the following schedule:

15% of total order upon issuance of the purchase order or contract
30% on drawing transmittal
45% six (6) weeks after drawing transmittal
10% upon notice of availability of shipment

Escalation charges shall be applied to orders whose delivery dates are delayed beyond thirty (30) days from the contractual delivery date due to no fault of John Zink and when such delay has caused an increase in the cost of the goods or services to John Zink. Escalation charges shall be based upon either: (1) the Producer Price Index as published by the U.S. Department of Labor, Bureau of Labor Statistics for Finished Goods, Capital Equipment only, or (2) the U.S.

Department of Labor, Employment Cost Index (ECI), Private Industry, Table 3. Employment Cost Index for total compensation for private industry workers, by industry and occupational group; Manufacturing Industry, as applicable. The base line for calculating the adjustment shall be the date of the contract.

7.0 Exceptions & Clarifications

None received. - John Zink standard scope, materials, design and fabrication methods include.

Important Note: John Zink will require a thorough review of the installations before a final proposal can be submitted to assure the FGR Inlet Box Package and Silencer equipment proposed will fit in the area. If there is not enough room, John Zink will need to look at other options.

8.0 Delivery

Drawings will be submitted eight to ten (8-10) weeks after receipt of purchase order and all engineering information. Shipment will be twelve to fourteen (12-14) weeks from receipt of approved drawings. Note that dates are preliminary and will be firmed up at time of order placement.

The following drawings/documents will be submitted for approval:

FGR Inlet Box / FD Fan Arrangement P&ID - Updated Bill of Materials IOM Manual

9.0 Terms and Conditions

Equipment and/or services quoted are subject to the attached John Zink Company, LLC. General Terms and Conditions of Sale (the "T&Cs"), and is an offer to sell the goods or services specifically contingent upon acceptance of the T&Cs. This proposal (including, without limitation, the T&Cs), if resulting in an order, shall be incorporated by reference into any resulting contract documents. In the case of a conflict among the contract documents, then the terms of the proposal (including, without limitation, the T&Cs) shall take precedence.

This proposal document is confidential and intended solely for the use of the individual or entity to which it is addressed. If you have received this proposal in error, please contact the sender and destroy all copies of the original message.

We thank you for the opportunity to present this proposal and look forward to working with you on this project.

Very truly yours,

Wayne A. Wieszczyk | Sr. Application Engineer John Zink Company LLC 2151 River Plaza Drive, Suite 200 | Sacramento, CA 95833 T: +1.650.522.2128 M: +1.530.867.2856 E: wayne.wieszczyk@johnzink.com

Encl: Terms & Conditions

GENERAL TERMS AND CONDITIONS OF SALE (GOODS AND SERVICES)

- 1. APPLICATION. These General Terms and Conditions of Sale ("Terms and Conditions") will apply to all quotations and sales for goods, material, equipment and services by John Zink Company, LLC ("Seller") and are hereby incorporated into the purchase order, quotation, invoice or other document to which they are attached ("Order" and, together with the Terms and Conditions, the "Contract"). All purchases by customer, owner or its agent ("Buyer") are expressly limited and conditioned upon acceptance of the Terms and Conditions. Seller objects to and rejects any provision additional to or different from the Terms and Conditions that may appear in Buyer's purchase order, acknowledgement, confirmation, writing, or in any other prior or later communication from Buyer to Seller, unless such provision is expressly agreed to by Seller in a writing signed by Seller. For the purposes of these Terms and Conditions, the term "Goods" shall refer to the goods, material and equipment listed on the Order as well as all equipment or other materials provided in connection with any Services, and the term "Services" shall refer to the services listed on the Order. Terms not defined herein shall have the meanings set forth in the Order.
- 2. PRICE AND OTHER CHARGES. Unless otherwise stated in the Order, the Contract price does not include any packaging, transportation, duties, taxes or other charges (collectively, "Additional Charges"). Buyer shall be responsible for all applicable Additional Charges.
- 3. **PAYMENT TERMS.** (a) Unless otherwise stated in the Order, payment is due thirty (30) days after the invoice date. (b) All payments shall be made in USD unless otherwise specified in the Order. (c) Interest may be charged on all past due amounts owed by Buyer hereunder at an interest rate equal to the prevailing LIBOR rate of interest, expressed as an annual percent, plus three percent (3%) from the payment due date until paid in full, or the highest interest rate allowed by applicable law, whichever is less. Payments must be made via a financial institution that is not subject to the sanctions laws of the United States, the European Union, or other applicable jurisdictions.
- 4. **CREDIT TERMS.** If, in Seller's judgment, the creditworthiness or future performance of Buyer is or may become impaired or unsatisfactory, Seller may suspend performance hereunder and seek adequate assurances from Buyer. Buyer shall pay (or otherwise reimburse) Seller for any costs associated with such suspension (including charges for reactivation). Without limiting the foregoing, Seller may, for any reason, (a) require prepayment by wire transfer at least two (2) business days prior to a scheduled shipment of Goods or provision of Services, and/or (b) require Buyer to issue letter(s) of credit in a form, and from an issuing bank, acceptable to Seller at least three (3) business days prior to a scheduled shipment of Goods or provision of Services.
- 5. DELIVERY. (a) Unless otherwise stated in the Order, delivery of the Goods shall be EXW (Incoterms®2010 International Chamber of Commerce (ICC) publication) Seller's designated manufacturing facility. (b) If Buyer has not issued inspection and shipping instructions by the time the Goods are available to Buyer, Seller may, at its sole discretion, (i) store the Goods at Buyer's risk of loss and cost, or (ii) select any reasonable method of shipment, without liability by reason of its selection, costs of shipment and risk of loss to be the responsibility of Buyer. (c) Shipments or Goods in storage may be insured at Buyer's expense.
- 6. TITLE/RISK OF LOSS. Unless otherwise stated in the Order, title in the Goods shall pass to Buyer upon payment in full. The risk of loss or damage to the Goods shall pass to Buyer upon delivery in accordance with the Contract or as otherwise provided in the Delivery section.
- 7. **INSPECTION/REJECTION OF GOODS.** All Goods shall be received subject to Buyer's reasonable inspection and rejection. Buyer may only reject Goods that do not conform in all material respects to the specifications contained in the Contract. Rejected Goods will be held at Seller's risk for a reasonable time, to be returned or disposed of by Buyer at Seller's written instruction and at Seller's sole cost and expense. A failure by Buyer to reject nonconforming Goods in writing within thirty (30) days after receipt shall constitute an unqualified acceptance of such Goods by Buyer and a waiver by Buyer of all claims with respect thereto. Thereafter, nonconforming Goods shall be subject to the Warranty section.
- 8. WARRANTY. (a) Seller warrants that (i) the Goods shall be new and good quality and shall conform to the specifications specifically set forth in the Order and title to the Goods shall be free from any security interest, lien or encumbrance upon Seller's receipt of full payment for the Goods, and (ii) Seller shall perform the Services in a workmanlike manner in accordance with the specifications specifically set forth in the Order. (b) The foregoing warranties will last for the following period (the "Warranty Period"): (i) for Goods, eighteen (18) months after the date that the Goods are available for shipment or one (1) year after first start-up, whichever occurs first; and (ii) for Services, three (3) months after completion of the Services. If during the Warranty Period any Goods or Services prove not to meet the warranties set forth above, Seller will repair the Goods or supply identical or substantially similar replacement Goods EXW Seller's manufacturing facility, at Seller's sole discretion, or re-perform the Services (as applicable). Any replacement Goods or re-performed Services will be warranted for the unexpired portion of the Warranty Period applicable to the Goods or Services. (c) Seller will not be responsible for transportation costs or for the costs of removal, installation, re-installation or making of access of any Goods or other items, where such transportation, removal, installation, re-installation or making of access is required to repair or replace any defective Goods or to re-perform Services. Furthermore, Seller will not be responsible for and assumes no liability for materials or workmanship, labor costs or other related expenses for any work performed by Buyer or third parties (not authorized by Seller) in the repair or replacement of defective Goods or the re-performance of Services. (d) Seller's warranties will be voided if (i) the Goods or the subject of the Services have not been stored, installed, maintained or operated in accordance with accepted industrial practice or any specific instructions provided by Seller; (ii) the Goods or the subject of the Services have been subjected to any accident, misapplication, environmental contaminant, corrosion, damage, debris, improper passivation, abuse or misuse; (iii) Buyer has modified the Goods or the subject of the Services without Seller's prior written consent; (iv) Buyer has used or repaired the Goods or the subject of the Services after discovery of the defect without Seller's prior written consent; (v) Buyer or any third party refuses to permit Seller to examine the Goods or the subject of the Services and operating data to determine the nature of the defect claimed; or (vi) Buyer fails to meet its financial obligations under the Contract. (e) Goods not manufactured by Seller are subject only to warranties of Seller's vendors and Seller hereby assigns to Buyer all rights in such vendors' warranties, however, Seller shall furnish to Buyer reasonable assistance in enforcing such rights. (f) Inexpensive items requiring repair or replacement and routine maintenance-related or consumable items shall be outside the scope of these limited warranties. (g) Seller's performance guarantees, if any, shall be deemed to be met by a satisfactory demonstration of the guaranteed performance parameters during a performance test, which shall be the responsibility of Buyer and is to be based on test procedures as specified in the Order or, if not specified in the Order, to be based on test procedures mutually agreed upon by Seller and Buyer. In the absence of a performance test within sixty (60) days of delivery, unless otherwise specified in the Order, Seller's performance guarantees are deemed to have been met. (h) ALL WARRANTIES OR REPRESENTATIONS NOT SPECIFICALLY INCLUDED IN THESE TERMS AND CONDITIONS, INCLUDING THOSE WITH RESPECT TO MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE WHETHER EXPRESSED, IMPLIED, STATUTORY OR ARISING FROM A COURSE OF DEALING, USAGE OF THE TRADE OR OTHERWISE WITH RESPECT TO ANY GOODS OR SERVICES, ARE EXPRESSLY EXCLUDED. NO EXPRESS OR IMPLIED WARRANTY IS GIVEN AS TO THE CAPACITY, EFFICIENCY OR PERFORMANCE OF ANY GOODS, EXCEPT AS MAY BE PROVIDED IN A SEPARATE WRITTEN AGREEMENT SIGNED BY SELLER. (i) BUYER'S REMEDIES ARE SPECIFICALLY LIMITED TO THE REPAIR OR REPLACEMENT OF THE GOODS OR THE RE-PERFORMANCE OF THE SERVICES, AS APPLICABLE, DURING THE WARRANTY PERIOD, AND ARE EXCLUSIVE OF ALL OTHER REMEDIES. SHOULD THESE REMEDIES BE FOUND INADEQUATE OR TO HAVE FAILED OF THEIR ESSENTIAL PURPOSE FOR ANY REASON WHATSOEVER, BUYER AGREES THAT RETURN OF THE AMOUNT PAID BY BUYER TO SELLER FOR THE GOODS INVOLVED SHALL PREVENT THE REMEDIES FROM FAILING OF THEIR ESSENTIAL PURPOSE AND SHALL BE CONSIDERED BY BUYER AS A FAIR AND ADEQUATE REMEDY.
- 9. BACKCHARGES. No backcharges will be paid or allowed by Seller unless (i) Seller is notified in writing of Buyer's intent to incur costs and (ii) Seller provides prior written approval of such backcharges.
- 10.**OBLIGATIONS OF BUYER.** Buyer is solely responsible for identifying and defining all processes, mechanical considerations, and site requirements, which may affect the performance, reliability or operation of the Goods or Seller's performance of Services. Buyer represents that all information and data provided to Seller by or for Buyer is current, complete, and accurate. Buyer represents and warrants to Seller that Buyer has all necessary rights and permissions to provide all information provided by or on behalf of Buyer to Seller and shall indemnify Seller from any third party with respect to Seller's use of such information in connection with the Contract.
- 11.INDEMNITY. In the event that Seller performs onsite services at Buyer's facility, (i) Seller shall defend, indemnify and hold harmless Buyer against all damages, losses, costs, claims, liabilities, and expenses (including reasonable attorneys' fees), resulting from bodily injury, including death, or damage to tangible property to a Third Party, to the extent caused by the negligent acts or omissions of Seller, its officers, directors, employees or agents ("Seller Group"); and (ii) Buyer shall defend, indemnify and hold harmless Seller against all damages, losses, costs, claims, liabilities and expenses (including reasonable attorneys' fees), resulting from bodily injury, including death, or damage to tangible property to a Third Party, to the extent caused by the negligent acts or omissions of Buyer, its officers, directors, employees or agents ("Buyer Group"). All liability, losses, damages, costs or expenses resulting from bodily injury, including death, or damage to tangible property to a Third Party, to the extent caused by the negligent acts or omissions of Buyer, its officers, directors, employees or agents ("Buyer Group"). All liability, losses, damages, costs or expenses resulting from bodily injury, including death, or damage to tangible property to a Third Party, caused by the joint or concurring acts of Buyer Group and Seller Group, shall be borne by Buyer and Seller to the extent each is determined negligent either by agreement of the parties or by a court of competent jurisdiction. The term "Third Party" shall mean any person or entity that is not a member of Seller Group, Buyer Group, the end user of the Goods or subject of the Services, or any of its respective affiliates, parent(s), subsidiaries or any of their respective officers, directors, employees, agents, or subcontractors.
- 12.DEFAULT. Upon the occurrence of any of the following events: (i) Seller has not received a payment due from Buyer hereunder by the date such payment is due under the Contract, and such failure remains uncured for a period of ten (10) business days after Buyer's receipt of written notice from Seller of such non-payment; (ii) Seller is unable to meet its warranty obligations and fails to commence to cure within ten (10) business days after Seller's receipt of written notice from Buyer of such uncured obligation; or (iii) Seller or Buyer fail to perform other material obligations in the Contract and such failure remains uncured for a period of thirty (30) business days after receipt of written notice from the other party of such uncured obligation, or if cure is not possible within that period, the defaulting party fails to make continuous and diligent efforts to cure, then the non-defaulting party, in its sole discretion and without prior notice (other than as provided above) to the defaulting party, may do any one or more of the following: (a) suspend performance under the Contract; or (b) terminate the Contract, whereby any and all obligations of the defaulting party will, at the option of the non-defaulting party, become immediately due and payable or deliverable, as applicable. In the event of default by Buyer, Seller shall have the right to withhold delivery and/or sell the Goods to a third party and deduct from proceeds of such sale the purchase price and all reasonable costs resulting from the default. The prevailing party shall be entitled to recover all court costs, reasonable attorneys' fees and expenses incurred by the prevailing party in connection with the default, and interest on past due amounts as set forth in the payment terms of the Contract.
- 13.**INTELLECTUAL PROPERTY.** (a) Seller retains all intellectual property rights, whether registered or un-registered, including trademarks, patents, and copyright of all documents, drawing rights, design rights, developed programs, software, models and other data provided or developed in the course of the Contract ("Seller IP"), and hereby grants Buyer a non-exclusive, non-assignable royalty free license to use Seller IP delivered to Buyer or embodied in the Goods or related deliverables only for the purposes of Buyer's installation, operation and maintenance the Goods. (b) Seller will defend and indemnify Buyer from any claim, suit or proceeding brought against Buyer based on a claim that the Goods as manufactured and furnished by Seller and used

in the manner for which it was intended and sold to Buyer constitutes an infringement of any United States, Canadian or European Union-member patent, if Seller is notified promptly in writing and given authority, information and assistance for the defense of such claim, suit or proceeding. All aspects of the defense and settlement of any such claim, suit or proceeding shall be within Seller's sole discretion. Buyer remains solely responsible for its own costs, including all fees and expenses of its own counsel, if any, or its personnel, which are incurred in conjunction with the defense of such claim, suit or proceeding. Should it be held that the Goods, constitute an infringement and the use of the Goods is enjoined, Seller will, at its sole discretion and at its own expense, either procure for Buyer the right to continue using the Goods, replace the Goods with non-infringing goods, modify the Goods to become non-infringing or refund the purchase price for the infringing Goods. Seller's obligations to defend, and indemnify Buyer shall not apply to any liability for infringement (i) of any method patent where the Goods are used with other apparatus for carrying out a process resulting in a combination of steps which is deemed to infringe a method patent or patent directed to a combination of steps, (ii) where the Goods are used by Buyer in a manner different than the use communicated to and understood by Seller at the time the Goods were sold to Buyer and such use constitutes infringement, or (iv) with respect to claims of infringement where the Goods were designed and manufactured in accordance with the design or specifications furnished or required by Buyer. (c) Buyer will indemnify and hold harmless Seller from any suit or proceeding brought against Seller by any third party based on claims resulting from exceptions (i), (ii), (iii) or (iv) as stated above.

- 14.DELIVERY DATE. If the Order specifies a delivery date, Seller shall use commercially reasonable efforts to meet the requested date.
- 15.CANCELLATION FEE. Buyer may not cancel any part of the Contract except upon written notice and payment to Seller for (a) all Goods or Services completed prior to cancellation, (b) all costs incurred by Seller prior to cancellation, (c) all reasonable costs arising due to the cancellation, (ii) unavoidable third party charges, and (iii) a cancellation fee in the amount of twenty percent (20%) of the total price of the Contract. The parties agree that Seller's damages following a termination of any part of the Contract by Buyer are difficult to determine and that the cancellation fee provided by this provision is a genuine pre-estimate of loss and not a penalty and is reasonable in light of the circumstances. Seller shall be entitled to the payments set forth above if Seller cancels or terminates the Contract pursuant to the Default and Suspension sections. Title to all works in progress and all materials not delivered to Buyer prior to the date of cancellation with Seller.
- 16.SUSPENSION. (a) Buyer may only suspend the Order upon written notice to Seller, subject to payment of Seller's costs. (b) If Buyer or any of its agents delays Seller's performance due to failure to promptly approve drawings or procedures or due to any other action or non-action on part of Buyer or its agents: (i) Buyer shall reimburse Seller for all costs incurred up to the date of suspension and as a result of such delay (including costs of reactivation), (ii) the delivery time shall be adjusted, and (iii) milestone payments (if applicable) will be adjusted to keep Seller whole for costs incurred up to the date of delay or suspension. (c) If, due to any action or non-action on the part of Buyer or its agents, Seller is delayed for more than forty-five (45) days, or such longer period of time as deemed reasonable by Seller in its sole discretion, Seller may elect to cancel the Order.
- 17.FORCE MAJEURE. Force Majeure means any circumstances beyond the reasonable control of either party, including acts of God, fire, explosion, breakdown of machinery or equipment, third party supplier plant shutdown, strikes or other labor disputes of Seller's suppliers or subcontractors, acts of terrorism or war, riots or other civil disturbances or voluntary or involuntary compliance with any law, order, regulation, recommendation or request of any governmental authority, inability to obtain materials necessary for manufacture of the Goods, total or partial failure of any of Seller's usual means of transportation of the Goods, or for failure to obtain necessary governmental approvals, permits or licenses. Neither party will have any liability, other than for the payment of monies owing, for their failure to perform any of their contractual obligations arising out of or in connection with events of Force Majeure.
- 18. ASSIGNABILITY. The rights and duties under the Contract are not assignable or transferable by Buyer or Seller, in whole or in part, by operation of law or otherwise, without the prior written consent of the non-assigning party, which consent may not be unreasonably withheld, delayed, or conditioned. Notwithstanding, upon written notice, Buyer or Seller may assign this Contract in whole or in part to any of its affiliates which are as equally creditworthy and provided such affiliate is compliant with all applicable laws. Any assignment or attempted assignment in contravention of the foregoing shall be null and void. Any assignee is subject to all of the obligations, liabilities, waivers and limitations of this Contract.
- 19.GOVERNING LAW. The Contract, and its execution, performance, interpretation, construction and enforcement, shall be governed by the law, both procedural and substantive, of the State of Texas, without regard to its conflicts of law rules; and all claims relating to or arising out of the Contract, including breach, and formation, whether sounding in contract, tort or otherwise, shall likewise be governed by the laws of the State of Texas, excluding choice-of-law principles. Any action or proceeding between Buyer and Seller relating to the Contract shall be commenced and maintained exclusively in the State or federal courts in Harris County, Houston, Texas; and, Buyer waives all venue and inconvenience of forum challenges and irrevocably submits itself unconditionally and irrevocably to the personal jurisdiction of such courts. BUYER AND SELLER EACH WAIVE, TO THE FULLEST EXTENT PERMITTED BY LAW, ANY RIGHT IT MAY HAVE TO A TRIAL BY JURY IN RESPECT TO ANY SUIT, ACTION, CLAIM OR PROCEEDING RELATING TO THE CONTRACT.
- 20.NOTICE. All official notices, made under this Agreement must be made via certified or registered mail with return receipt, postage prepaid addressed to the party to whom such notice is given at the address of such party stated in the Contract. All other communications or transmittals under the Contract shall be in writing and shall be deemed received on the day of delivery if personally hand delivered or sent by facsimile or electronic transmission (with written confirmation of the completed transmittal).
- 21.ENTIRE AGREEMENT; AMENDMENT; WAIVERS. This Contract supersedes all prior negotiations, discussions, and dealings concerning the subject matter hereof, and shall constitute the entire agreement between Seller and Buyer concerning the subject matter hereof. There are no understandings, inducements, conditions, representations or warranties of any kind, whether direct, indirect, collateral, express or implied, oral or written, from either party to the other, other than as contained in this Contract. No party shall claim any amendment, modification or release of any provisions hereof unless the same is in writing and signed by Buyer and Seller. No waiver by Buyer or Seller of any breach of any terms, conditions or obligations under the Contract shall be deemed a waiver of any continuing or subsequent breach of the same or any other terms, conditions or obligations hereunder.
- 22.ELECTRONIC TRANSACTIONS. The Contract may be digitally copied and stored on electronic storage media or devices (the "Imaged Agreement"). The Imaged Agreement (once digitally regenerated to paper form), and any facsimile, and all computer records of the foregoing, if introduced as evidence in any judicial, arbitration, mediation or administrative proceedings, will be admissible as between the parties to the same extent and under the same conditions as other business records originated and maintained in documentary form and neither party shall object on the basis that such business records were not originated or maintained in documentary form under any rule of evidence.
- 23. COMPLIANCE. Buyer and Seller shall: (i) comply fully with all applicable laws and regulations in their respective performances of the Contract; and, (ii) shall neither take nor refrain from taking any action that could result in liability for either party under applicable law, including the U.S. Foreign Corrupt Practices Act, the OECD Anti-Bribery Convention or any other applicable anti-bribery law or treaty, or those regulations maintained by the U.S. Treasury Department's Office of Foreign Assets Control (31 C. F. R. Chapter V) or the U.S. Commerce Department's Bureau of Industry and Security (15 C.F.R. Parts 730 et. Seq.). Buyer shall comply as follows: (i) Buyer acknowledges that any distribution, sale, transfer or re-export of the Goods is governed by and subject to the trade control laws of the United States; (ii) Buyer shall not distribute, sell, transfer or re-export the Goods, except in conformance with United States law; and, (iii) If Buyer knows or has reason to know that any of its customers intend to distribute, sell, transfer or re-export the Goods, except in conformance with united States (iii) Buyer shall inform its customer is responsible for obtaining any licenses or other approvals from the U.S. Government before such distribution, sale, transfer or re-export, by including the following language in Buyer's purchase order acknowledgement or other appropriate documentation to its customer: *NOTICE: The products, technical data, and/or software included in this Order were provided in compliance with the laws and regulations of the United States. Customer is responsible for obtaining all licenses, permits or other approvals that may be necessary under the laws of the United States before any distribution, sale, transfer or re-export for such iters and for ensuring that the end-user and end use of these products are permitted under U.S. law. Re-export, diversion, transhipment, or use contrary to U.S. law is prohibited and is cause for cancellation of this [purchase order]." Nothing in this Con*
- 24.**INDEPENDENT CONTRACTORS.** Seller and Buyer are independent contractors only and are not partners, master/servant, principal/agent or involved herein as parties to any other similar legal relationship with respect to the transactions contemplated under the Contract or otherwise, and no fiduciary, trust, or advisor relationship, nor any other relationship imposing vicarious liability shall exist between the parties under the Contract or otherwise at law.
- 25.NO THIRD PARTY BENEFICIARIES. The Contract is solely for the benefit of, and shall inure to the benefit of, Buyer and Seller, and shall not otherwise be deemed to confer upon or give to any third party any right, claim, cause of action or other interest herein.
- 26.SEVERABILITY. The invalidity or unenforceability of any provision of the Contract shall not affect the validity or enforceability of its other provisions and the remaining provisions shall remain in full force and effect.
- 27. CONFIDENTIALITY. Except as provided in a separate written confidentiality agreement, all information that Buyer acquires from Seller hereunder, directly or indirectly, and all information that arises out of the sale of the Goods and/or Services hereunder, concerning such Goods, Services, and/or proprietary processes involved, including, but not limited to, information concerning Seller's current and future business plans, information relating to Seller's operations, know-how, and other Seller-furnished information shall be deemed Seller's "Proprietary Information". Buyer shall (a) hold Seller's Proprietary Information in strictest confidence, (b) not disclose it to others and (c) use it solely for purposes of the Contract.
- 28.INSURANCE. In the event the Seller performs onsite services at Buyer's facility, Seller shall maintain the following insurance coverage during the term of the Contract and, at Buyer's request, shall provide Buyer with a certificate evidencing such coverage: (a) Statutory Workers' Compensation and Employer's Liability Insurance, with limits of Five Hundred Thousand USD (\$500,000.00) each accident, Five Hundred Thousand USD (\$500,000.00) disease each employee, and Five Hundred Thousand USD (\$500,000.00) disease policy limit; (b) Commercial General Liability Insurance, with a combined single limit for bodily injury and property damage of One Million USD (\$1,000,000.00) per occurrence and in the aggregate; and (c) Automobile Liability Insurance, with a combined single limit for bodily injury and property damage of One Million USD (\$1,000,000.00) per accident.
- 29.SURVIVAL. The provisions addressing indemnity, confidentiality, limitation of liability, and all other provisions which by their nature are intended to survive, shall survive expiration or termination of the Contract.
- 30.**MISCELLANEOUS.** The captions and section headings set forth in the Contract are used for convenience only and shall not be used in defining or construing any of the terms and conditions set forth in the Contract. The term "**days**", as used herein, shall mean actual days occurring, including, Saturdays, Sundays and holidays where banks are authorized to be closed in the city where Seller's chief executive office is located. The term "**business days**" shall mean days other than Saturdays, Sundays and holidays where banks are authorized to be closed in the city where

Seller's chief executive office is located. The term "including" or any variation thereof means "including, without limitation" and shall not be construed to limit any general statement that it follows to the specific items immediately following it. Unless the context indicates otherwise, words importing the singular number shall include the plural and vice versa, and words importing person shall include firms, association, partnerships and corporations, including public bodies and governmental entities, as well as natural persons, and words of macculine gender shall be deemed to include correlative words of the feminine gender and vice versa as the circumstances may require. The United Nations Convention on Contracts for the International Sale of Goods shall not apply.

31.LIMITATION OF LIABILITY. (A) NO PARTY SHALL BE LIABLE FOR INDIRECT, INCIDENTAL OR CONSEQUENTIAL DAMAGES, INCLUDING LOSS OF PROFITS, REVENUES, OR OTHER ECONOMIC LOSSES WHETHER DEEMED DIRECT OR CONSEQUENTIAL, ARISING UNDER ANY CAUSE OR COMBINATION OF CAUSES, INCLUDING ANY THEORIES OF CONCURRENT OR JOINT LIABILITY. (B) THE LIABILITY OF SELLER AND ITS AFFILIATES IS LIMITED TO THE PRICE ALLOCABLE TO THE GOODS OR SERVICES DETERMINED TO BE DEFECTIVE, AND IN NO EVENT WILL THE CUMULATIVE LIABILITY OF SELLER AND ITS AFFILIATES BE IN EXCESS OF THE TOTAL PAYMENTS RECEIVED FROM BUYER UNDER THE ORDER REGARDLESS OF CAUSE OR ANY COMBINATION OF CAUSES WHATSOEVER. ALL INSURANCE, BOND AND BANK GUARANTEE OR LETTER OF CREDIT PROCEEDS WHICH MAY BE PAID BY THE INSURERS, SURETIES OR BANKS OF SELLER OR ITS AFFILIATES WILL BE CREDITED AGAINST THE LIMITATION STATED ABOVE AND SHALL REDUCE THE AMOUNT OF THE CUMULATIVE LIABILITY OF SELLER AND ITS AFFILIATES. (C) BUYER'S REMEDIES ARE LIMITED TO THOSE REMEDIES EXPRESSLY STATED IN THIS CONTRACT. (D) THESE LIMITATIONS SHALL APPLY NOTWITHSTANDING ANY FUNDAMENTAL BREACH OR FAILURE OF ESSENTIAL PURPOSE OF ANY LIMITED REMEDY.

ATTACHMENT #3 NYC – DOC Rikers Island Cogeneration Plant LAER Analysis

1 Introduction and Background

The Rikers Island Correctional Facility is considered an existing major facility for the determination of New Source Review (NSR) and Prevention of Significant Deterioration (PSD). Existing facility Potential-to-Emit (PTE) emissions of nitrogen oxides (NO_x) exceed the Major Facility Threshold (MFT) at 426.16 tons per year (TPY) and is therefore the facility is subject to the NSR and PSD requirements under Title 6 of the New York Codes, Rules, and Regulations (NYCRR), Chapter III, Part 231. This Lowest Achievable Emission Rate (LAER) technology analysis for the cogeneration plant at the Rikers Island Correctional Facility is being submitted as part of the facility's requirements under Part 231 and is included as an attachment to the Title V permit renewal application.

1.1 NON-ATTAINMENT NEW SOURCE REVIEW (NANSR) - 6 NYCRR PART 231-6

New Source Review is a federal program, which has been delegated to the states, including New York. Part 231-6 applies to nonattainment pollutants proposed to be emitted from modifications to existing major facilities in nonattainment areas and attainment areas of the State within the Ozone Transport Region. The intent of the program is to require such facilities to control emissions of pollutants whose ambient concentrations have been determined to cause or contribute to violations of National Ambient Air Quality Standards (NAAQS). Emissions of NO_x, volatile organic compounds (VOC), and particulate matter less than 2.5 microns in diameter (PM_{2.5}) are subject to nonattainment NSR (NANSR) since these already exceed their respective NAAQS in the area. Sulfur dioxide (SO₂) is also treated as a non-attainment pollutant since it is a precursor to PM_{2.5} in a PM_{2.5} non-attainment area.

The Rikers Island Cogeneration Plant is located in a moderate ozone non-attainment area. The Project consists of two (2) natural gas fired simple-cycle Solar Taurus 70-10801S gas turbines, rated at 7.5 MW each, and are individually equipped with duct firing heat recovery steam generators (HRSGs). NO_x emissions from the cogeneration plant are 52.0 tons/year, greater than the 25 tons/year significant net emissions increase threshold under NSR. Therefore, Part 231 requires the application of LAER technology to minimize emissions.

LAER is defined in 6 NYCRR Part 200 as:

"the most stringent emission limitation achieved in practice, of which can reasonably be expected to occur in practice for a category of emission sources taking into consideration each air contaminant which must be controlled. In no event shall the application of this term permit a proposed new source or modification to emit any air contaminant in excess of the amount permitted under any applicable emission standard established under 6 NYCRR or 40 CFR."

The three rationales provided by the LAER evaluation process that allow a technology to be determined to be technically or economically infeasible are:

- The technology has never been implemented successfully on a similarly configured full-scale operation within the industry category;
- The technology causes or increases emissions of one or more pollutants which could result in significant environmental impacts; or
- The technology is so expensive that, if required, would prevent the entire project from being built.

1.2 Nitrogen Oxides

During combustion, NO_x is primarily formed in two ways: fuel NO_x and thermal NO_x .

Thermal NO_x refers to the high temperature reaction of atmospheric nitrogen and oxygen from the combustion air. The reaction rate is highly dependent on temperature and thus the thermal environment in the flame zone primarily controls thermal NO_x formation. Thermal NO_x is dependent to a lesser extent on the availability of oxygen in the flame zone.

Fuel NO_x is formed by the oxidation of organic bound nitrogen in the fuel during combustion. Fuel NO_x formation is less sensitive to temperature compared to thermal NO_x, but it is strongly influenced by oxygen availability. Fuel NO_x formation is also directly related to fuel nitrogen content. Both fuel NO_x and thermal NO_x mechanisms are important with the combustion of fuel oil. Natural gas, however, contains no fuel bound nitrogen and thus NO_x is formed only by the thermal NO_x mechanism.

A third form of NO_x, "prompt NO_x", is formed during the oxidation of molecular nitrogen present in the combustion air stream in areas of the flame envelope that are "fuel rich". Under these fuel rich conditions, particularly when stoichiometry is under 0.60, both hydrogen cyanide (HCN) and ammonia (NH₃) can be formed through the rapid reaction of CH radicals with N2 to form HCN and N. Below a stoichiometry of 0.50, almost all NO_x formed is prompt NO_x. Although prompt NO_x is temperature sensitive, the temperature is not as great as with thermal NO_x. The rate of formation of prompt NO_x is extremely rapid, being complete in approximately 1 millisecond. Under fuel rich conditions and a temperature of just 2,400 °F, 20 ppm of prompt NO_x still remains. In most cases, prompt NO_x emissions are negligible.

 NO_x formation can be limited by lowering combustion temperature and staging combustion (a reducing atmosphere followed by an oxidizing atmosphere). NO_x emission controls are divided into two categories: post combustion emission reduction and in-furnace combustion control. Post-combustion NO_x controls reduce a portion of the NO_x exiting the combustion zone to nitrogen. In-furnace formation control processes reduce the quantity of NOx formed during the combustion process.

2 Rikers Island Cogeneration Plant Equipment

2.1 EXISTING COGENERATION TURBINES

The Solar Taurus 70-10801S combustion turbines went into operation January of 2015 and are equipped with SoLoNOx technology, which allows the equipment to achieve 15 ppm_{vd} NO_x at 15% O₂. This technology is Dry Low Emissions (DLE) combustion, which relies on lean-premix combustion. This reduces the conversion of atmospheric nitrogen to NO_x by reducing the combustor's flame temperature. Since NO_x formation rates are strongly dependent on flame temperature, lowering this temperature is an effective strategy for reducing NO_x emissions.

The combustion turbines underwent performance stack testing in October of 2018. The NO_x emission for Turbine 1 without duct burner firing was 9.92 ppm_{vd} at 15% O₂, and with the duct burner in operation it was 11.89 ppm_{vd} at 15% O₂. The NO_x emission for Turbine 2 without duct burner firing was 6.87 ppm_{vd} at 15% O₂, and with the duct burner in operation it was 9.70 ppm_{vd} at 15% O₂. The test results for both turbines are below the proposed NOx emission limit of 15 ppm_{vd} at 15% O₂.

2.1.1 Consideration of Post Combustion NO_x Control Technology

Selective Catalytic Reduction (SCR) is a post-combustion NO_x control technology involving the injection of ammonia (NH_3) or urea into the exhaust gas stream upstream of a specialized catalyst module, promoting conversion of NO_x to molecular nitrogen. The catalyst bed is used to lower the activation energy required for NO_x decomposition. The major components of an SCR system include an ammonia storage tank, an injection grid (system of nozzles that spray NH_3 into the exhaust gas ductwork), a structured, fixed-bed catalyst module, and electronic controls. In the SCR process, NH_3 , usually diluted with air or steam, is injected through a grid system into the exhaust gas upstream of the catalyst bed. On the catalyst surface, the NH_3 reacts with NO_x to form molecular nitrogen and water. The basic reactions are:

 $4NH_3 + 4NO + O_2 \rightarrow 4N_2 + 6H_2O$

 $8NH_3 + 6NO_2 \rightarrow 7N_2 + 12H_2O$

 $NH_3 + O_2 \rightarrow NO_X + H_2O$

The first and second equations reflect the NO_x reduction reaction. The third equation reflects the formation of NO_x by a side reaction in an SCR if the actual temperature exceeds the optimum reaction temperature. At these high temperatures, NO_x emissions actually increase and SCR is counter-productive. The reaction mechanism involved in the process is very temperature-sensitive and can be used to reduce NO_x only within a narrow temperature window.

Optimum NO_x reduction occurs at catalyst bed temperatures of 600-750°F for conventional (vanadium or titanium based catalysts) and 470-510°F for platinum catalysts. A high temperature zeolite catalyst is also available; it can operate in the 600°F–1000°F temperature range. However, these catalysts are very expensive. A given catalyst provides optimal performance within + 50°F of its design temperature for applications in which flue gas oxygen concentrations are greater than 1 percent. Below this optimum range, the catalyst activity is greatly reduced allowing unreacted NH₃ to slip through (ammonia slip). At temperatures above 850°F ammonia begins to oxidize to form additional NO_x. The NH₃ oxidation to NOx increases with increasing temperature. The normal NO_x control efficiency range for SCR is 70 percent to 90 percent. However, with low NO_x burners, such a reduction is problematic.

The design and installation of an SCR system on the turbines was considered as an alternative to the SoLoNOx technology; however, adding this technology was disregarded during the design phase due to issues of site safety and security within the Rikers Island prison complex. Installation of an SCR system was again considered as an add-on control but was considered infeasible due to similar concerns. Furthermore, the City is currently planning to establish a system of four new borough-based detention facilities to house prison populations in order to no longer detain people in the jails on Rikers Island. With the completion of this project, which is anticipated by 2026, the City would close and decommission the jails on Rikers Island. Given the proposed closure of the prison complex in the future, the future ownership and operation of the cogeneration plant is uncertain.

3 Determining LAER

To determine LAER for the Rikers Island Cogeneration Plant, the impacts of the decision/evaluation criteria were considered with respect to the technology review for the LAER determination. A thorough review of applicable control technologies in USEPA's RACT/BACT/LAER Clearinghouse (RBLC) was conducted. The review is summarized in Table 1, and included as Attachment 1. The RBLC was searched using the two criteria: 16.110 - Small Combustion Turbines (< 25 MW), Simple Cycle burning Natural Gas; and - 16.210 Small Combustion Turbines (< 25 MW), Combined Cycle & Cogeneration burning Natural Gas. The permit data searched in RBLC resulted in 25 facilities that matched these criteria. Those results were further reduced by eliminating 16 facilities with post combustion controls (Selective Catalytic Reduction (SCR)), combined cycle plants, and combustion turbines operating at a peaker plant. The remaining 10 facilities are summarized in Table 1.

Facility	Permit Date	Turbine	Rating	Emission Limit ¹
Geisinger Medical Center Danville	01/30/2018	Cogeneration	4.0 MW	15 ppm ²
Grossmont Hospital	05/13/2016	Cogeneration	4.6 MW	9 ppm ²
Midwest Fertilizer Corporation	05/04/2016	Simple Cycle	20 MW	22.65 ppm
Calcasieu Pass LNG Project	06-19-2019	Simple Cycle	18.6 MW	25 ppm
DTE Gas Company Compressor Station	03/08/2018	Simple Cycle	7.83 MW	15 ppm
Sinton Compressor Station	03/06/2019	Simple Cycle	14.9 MW	25 ppm ²
Rose Valley Plant	07/29/2016	Simple Cycle	7.0 MW	15 ppm
Buffalo Creek Processing Plant	05/11/2018	Simple Cycle	7.6 MW	15 ppm
Qualcomm	05/30/2013	Simple Cycle	4.37 MW	5 ppm ²
Echo Springs Gas Plant	04/16/2009	Simple Cycle	A) 9.36 B) 2.88	A) 15 ppm ² B) 25 ppm ²

Table 1:
LAER emission limits for Small Natural Gas Fired Turbines
without Post Combustion Control

¹ All turbine emissions reported in ppm are in units of ppmvd at 15% O₂.

² Equipped with SoLoNOx, which is dry low NO_x combustion technology.

The results from the RBLC show that for small turbines firing natural gas without post combustion control, permit limits range from 5 ppmvd to 25 ppmvd at 15% O_2 . The lower end of the permit limits (5 ppmvd and 9 ppmvd at 15% O_2) were considered LAER for smaller turbines than the turbines installed at the Rikers Cogeneration Plant, while the upper end of the permit limits (from 15 ppmvd to 25 ppmvd at 15% O_2) were considered LAER for smaller. In addition, the federal New Source Performance Standard (NSPS), 40 CFR part 60, Subpart KKKK has an emission limit for turbines firing natural gas of 25 ppmvd at 15 percent O_2 .

Therefore, a LAER limit of 15 ppmvd at 15% O₂ is being proposed for the Rikers Island Cogeneration Plant.

POLLUTANT NAME:	Nitrogen Oxides (NOx)
CAS Number:	10102
Test Method:	Unspecified
Pollutant Group(s):	(InOrganic Compounds, Oxides of Nitrogen (NOx), Particulate Matter (PM))
Emission Limit 1:	15.0000 PPM
Emission Limit 2:	
Standard Emission:	
Did factors, other then air polluti	on technology considerations influence the BACT decisions: N
Case-by-Case Basis:	BACT-PSD
Other Applicable Requirements:	SIP , NSPS
Control Method:	(A) Dry ultra-low NOx burners.
Est. % Efficiency:	
Cost Effectiveness:	0 \$/ton
Incremental Cost Effectiveness:	0 \$/ton

Compliance Verified: Pollutant/Compliance Notes:	No The emission limit is 15 ppmvd for each turbine. The BACT emission limit subsumes the NSPS emission limit of 25 ppm at 15 percent O2. Normal baseload operation is considered to be loads greater than 50 percent of peak load and at or above 0 deg F. Startup and shutdown is considered to be the ramping up or ramping down of the turbines through loads 50 percent or less. There is also an emission limit for the NSPS that allows 150 ppmvd for each unit when operating at less than 75 percent of peak load and at temperatures less than 0 deg F. Selective catalyst reduction (SCR) was \$58,300/ton of controlled NOx for each turbine separately and Selective Non-Catalytic Reduction (SNCR) was \$46,200/ton of controlled NOx for each turbine separately. SCR was \$33,400-\$58,300 per ton of controlled NOx for all turbines combined, depending on control efficiency.
POLLUTANT NAME:	Carbon Monoxide
CAS Number:	630-08-0
Test Method:	Unspecified
Pollutant Group(s):	(InOrganic Compounds)
Emission Limit 1:	25.0000 PPM
Emission Limit 2:	
Standard Emission:	
Did factors, other then air pollut	ion technology considerations influence the BACT decisions: N
Case-by-Case Basis:	BACT-PSD
Other Applicable Requirements	: SIP
Control Method:	(P) Good combustion practices and clean burn fuel (pipeline quality natural gas).
Est. % Efficiency:	
Cost Effectiveness:	0 \$/ton
Incremental Cost Effectiveness:	0 \$/ton
Compliance Verified:	No
Pollutant/Compliance Notes:	The emission limit is 25 ppmvd for each turbine. The BACT emission limit is for normal operation. Normal baseload operation is considered to be loads greater than 50 percent of peak load and at or above 0 deg F. The emission limit does not include startup and shutdown or temperatures below 0 deg F. Startup and shutdown is considered to be the ramping up or ramping down of the turbines through loads 50 percent or less. An oxidation catalyst was \$10,162/ton of controlled CO.
POLLUTANT NAME:	Particulate matter, total $< 10 \mu$ (TPM10)

POLLUTANT NAME:	Carbon Dioxide Equivalent (CO2e)
CAS Number:	CO2e
Test Method:	Unspecified
Pollutant Group(s):	(Greenhouse Gasses (GHG))
Emission Limit 1:	196998.0000 T/YR 12-MO. ROLLING TIME PERIOD
Emission Limit 2:	
Standard Emission:	
Did factors, other then air polluti	on technology considerations influence the BACT decisions: N
Case-by-Case Basis:	BACT-PSD
Other Applicable Requirements:	
Control Method:	(P) Use of pipeline quality natural gas and energy efficiency measures.
Est. % Efficiency:	
Cost Effectiveness:	0 \$/ton
Incremental Cost Effectiveness:	0 \$/ton
Compliance Verified:	No
Pollutant/Compliance Notes:	The emission limit of 196,998 T/YR based on a 12-month rolling time period as determined at the end of each calendar month is combined for all turbines. The carbon capture and sequestration cost analysis was based upon the review performed for a different project. Key parameters were altered to make the analysis site-specific. Depending on how conservative the review was, the cost was between \$191 per ton of controlled combined CO2e and \$640 per ton of controlled combined CO2e. Terrestrial sequestration was \$162 per ton of controlled combined CO2e and does not include annual maintenance costs. Neither were considered to be economically feasible.

PROCESS FGAUXBOILERS (6 auxiliary boilers EUAUXBOIL2A, EUAUXBOIL3A, EUAUXBOIL2B, EUAUXBOIL3B, EUAUXBOIL2C, EUAUXBOIL3C)
NAME:
Process Type: 13.310 (Natural Gas (includes propane and liquefied petroleum gas))
Primary Fuel: Natural gas

Throughput: 3.00 MMBTU/H

Process Notes: Four natural gas-fired auxiliary boilers, each rated at 3 MMBTU/H fuel heat input (EUAUXBOIL2A, EUAUXBOIL3A, EUAUXBOIL2B and EUAUXBOIL3B in FGAUXBOILERS) and two natural gas-fired auxiliary boilers, each rated at 1 MMBTU/H fuel heat input (EUAUXBOIL2C and EUAUXBOIL3C in FGAUXBOILERS). The boilers are subject to 40 CFR Part 63 Subpart DDDDD which requires tune ups.

POLLUTANT NAME: Nitrogen Oxides (NOx)

CAS Number: 10102

Test Method:	Unspecified
Pollutant Group(s):	(InOrganic Compounds, Oxides of Nitrogen (NOx), Particulate Matter (PM))
Emission Limit 1:	20.0000 PPM AT 3% O2 EACH 3 MMBTU/H BOILER
Emission Limit 2:	9.0000 PPM AT 3% O2 EACH 1 MMBTU/H BOILER
Standard Emission:	
	ion technology considerations influence the BACT decisions: N
Case-by-Case Basis:	BACT-PSD
Other Applicable Requirements:	SIP
Control Method:	(B) Ultra-low NOx burners and good combustion practices.
Est. % Efficiency:	
Cost Effectiveness:	0 \$/ton
Incremental Cost Effectiveness:	0 \$/ton
Compliance Verified:	No
Pollutant/Compliance Notes:	Emission limit 1 above is 20 ppmvd at 3% O2 for each 3 MMBTU/H boiler and Emission limit 2 above is 9 ppmvd at 3% O2 for each 1 MMBTU/H boiler. Selective catalyst reduction (SCR) was \$117,718/ton of controlled NOx.
POLLUTANT NAME:	Carbon Monoxide
CAS Number:	630-08-0
Test Method:	Unspecified
Pollutant Group(s):	(InOrganic Compounds)
Emission Limit 1:	84.0000 LB/MMSCF EACH BOILER
Emission Limit 2:	
Standard Emission:	
Did factors, other then air pollut	ion technology considerations influence the BACT decisions: N
Case-by-Case Basis:	BACT-PSD
Other Applicable Requirements:	SIP
Control Method:	(P) Good combustion practices and clean burn fuel (pipeline quality natural gas).
Est. % Efficiency:	
Cost Effectiveness:	0 \$/ton
Incremental Cost Effectiveness:	0 \$/ton
Compliance Verified:	No
Pollutant/Compliance Notes:	An oxidation catalyst was \$19,200/ton of controlled CO and VOC.

POLLUTANT NAME: Particulate matter, total $< 10 \mu$ (TPM10)

CAS Number:	PM
Test Method:	Unspecified
Pollutant Group(s):	(Particulate Matter (PM))
Emission Limit 1:	0.5200 LB/MMSCF EACH BOILER
Emission Limit 2:	
Standard Emission:	
Did factors, other then air polluti	ion technology considerations influence the BACT decisions: ${ m N}$
Case-by-Case Basis:	BACT-PSD
Other Applicable Requirements:	SIP
Control Method:	(P) Good combustion practices and low sulfur fuel (pipeline quality natural gas).
Est. % Efficiency:	
Cost Effectiveness:	0 \$/ton
Incremental Cost Effectiveness:	0 \$/ton
Compliance Verified:	No
Pollutant/Compliance Notes:	The cost analysis was for multiple control types with a minimum cost of \$500,000.
POLLUTANT NAME:	Particulate matter, total $\leq 2.5 \mu$ (TPM2.5)
CAS Number:	PM
Test Method:	Unspecified
Pollutant Group(s):	(Particulate Matter (PM))
Emission Limit 1:	0.5200 LB/MMSCF EACH BOILER
Emission Limit 2:	
Standard Emission:	
Did factors, other then air polluti	ion technology considerations influence the BACT decisions: N
Case-by-Case Basis:	BACT-PSD
Other Applicable Requirements:	SIP
Control Method:	(P) Good combustion practices and low sulfur fuel (pipeline quality natural gas).
Est. % Efficiency:	
Cost Effectiveness:	0 \$/ton
Incremental Cost Effectiveness:	0 \$/ton
Compliance Verified:	No
Pollutant/Compliance Notes:	The cost analysis was for multiple control types with a minimum of \$500,000.

POLLUTANT NAME: Carbon Dioxide Equivalent (CO2e)

CAS Number:	CO2e
Test Method:	Unspecified
Pollutant Group(s):	(Greenhouse Gasses (GHG))
Emission Limit 1:	7324.0000 T/YR COMBINED FOR ALL BOILERS
Emission Limit 2:	
Standard Emission:	
Did factors, other then air polluti	ion technology considerations influence the BACT decisions: N
Case-by-Case Basis:	BACT-PSD
Other Applicable Requirements:	
Control Method:	(P) Use of pipeline quality natural gas and energy efficiency measures.
Est. % Efficiency:	
Cost Effectiveness:	0 \$/ton
Incremental Cost Effectiveness:	0 \$/ton
Compliance Verified:	No
Pollutant/Compliance Notes:	The emission limit above is 7324 T/YR combined for all boilers in FGAUXBOILERS. Carbon capture and sequestration was technically infeasible for small, intermittent sources. Terrestrial sequestration was \$162 per ton of controlled combined CO2e and does not include annual maintenance costs.

Incremental Cost Effectiveness:	0 \$/ton
Compliance Verified:	No
Pollutant/Compliance Notes:	The emission limit is 6,155 tons per year based on a 12-month rolling time period as determined at the end of each calendar month, for both boilers combined. Carbon capture and sequestration was technically infeasible for small, intermittent sources. Terrestrial sequestration was \$162 per ton of controlled combined CO2e and does not include annual maintenance costs.

Process/Poll	utant Information		
PROCESS	EUN_EM_GEN		
NAME:			
Process Type:	17.130 (Natural Gas (includes propane & liquified petroleum gas))		
Primary Fuel:	Natural gas		
Throughput:	225.00 H/YR		
Process Notes:) natural gas fueled emergency engine manufactured in 2011 or later. The engine is used to provide electrical power to the station in the event power from the public utility grid system is lost (EUN_EM_GEN). Restricted to 225 hours/year on a 12-month s.

Facility Infor	mation		
RBLC ID:	AK-0083 (final)	Date	
		Determination Last Updated:	02/19/2016
Corporate/Company	AGRIUM U.S. INC.	Permit	AQ0083CPT06
Name:		Number:	
Facility Name:	KENAI NITROGEN OPERATIONS	Permit Date:	01/06/2015 (actual)
Facility Contact:	TED HARTMAN 913 302 7469 TED.HARTMAN@AGRIUM.COM	FRS Number:	110030488620
Facility Description:	The Kenai Nitrogen Operations Facility is located at Mile 21 of the Kenai Spur Highway, near Kenai Alaska. It is classified as a nitrogenous fertilizer manufacturing facility under Standard Industrial Classification code 2873 and under North American Industrial Classification code 325311. The facility will produce ammonia and urea for bulk sale. There are two ammonia and two urea plants at Agrium's KNO facility. This permit authorizes the restart of one ammonia and one urea plant (plants 4 and 5). The ammonia plant converts natural gas with added steam and air to produce ammonia (NH3) and carbon dioxide (CO2). Feedstocks for the urea plant include CO2 and NH3. The utility plant generates the power and steam needed to operate the ammonia and urea plants. Final products are loaded at the Product Loading Wharf for shipment.	SIC Code:	2873
Permit Type:	A: New/Greenfield Facility	NAICS Code:	325311

PROCESS FG-PEAKERS: 2 natural gas fired simple cycle combustion turbines

NAME:

Process Type: 16.110 (Natural Gas (includes propane & liquified petroleum gas))

Primary Fuel: natural gas

Throughput: 171.00 MMBTU/H

Process Notes: Two natural gas fired simple cycle combustion turbines each with an electrical generator (nominal 13MW each; 171 MMBtu/hr heat input rating each). Each turbine is limited to 343 MMscf of natural gas per 12-month rolling time period as determined at the end of each calendar month. Both turbines combined are limited to 5.15 MMscf of natural gas each calendar day.

POLLUTANT NAME:	Nitrogen Oxides (NOx)					
CAS Number:	10102

Facility Information

RBLC ID:	OK-0153 (final)			Date Determination Last Updated:	07/29/2016
Corporate/Company	SEMGAS LP			Permit	2012-1393-С
Name:	DOOF VALLEY DI ANT			Number:	PSD
Facility Name:	ROSE VALLEY PLANT			Permit Date:	03/01/2013 (actual)
Facility Contact:	KRISTIN IKARD 405-727-1443 KRISTIN.II	KARD@ACCESSMIDS	TREAM.COM	FRS Number:	151-00432
Facility Description:	Mid-America Midstream Gas Services, L.L.C. (MAMGS) has applied for a permit to construct a new gas plant. A sic Code: 1321 summary of the new emission sources authorized under this construction permit is presented below: • Ten 1,775-hp Caterpillar G3606 engines equipped with oxidation catalysts. • Two 9,443-hp Siemens SGT-200-2S turbines. • Two 2,889-hp Caterpillar G3520C IM emergency generators with oxidation catalysts. • Two 5.605-MMBTUH regeneration heaters. • Two 17.4-MMBTUH hot oil heaters. • Four 1,000-bbl condensate storage tanks controlled by flares. • Four 400-bbl produced water tanks. • Two 20,000-bbl/day amine units. • Two 2.66-MMBTUH emergency flares. • One 0.99-MMBTUH enclosed flare. Facility-wide gas processing capacity will be 460 MMSCFD.				
Permit Type:	A: New/Greenfield Facility			NAICS Code:	211112
Permit URL:					
EPA Region:	6			COUNTRY:	USA
Facility County:	WOODS

PROCESS Amine Unit / Sweetening Unit

NAME:

Process Type: 50.999 (Other Petroleum/Natural Gas Production & Refining Sources (except 42 - Liquid Marketing))

Primary Fuel: NA

Throughput: 230.00 MMSCFD

Process Notes: The amine unit (MDEA) is equipped with a reboiler for regeneration of the amine. The off-gases from the reboiler are routed to the Acid Gas Flare. The waste gas combusted in the Acid Gas Flare is estimated at 10 MMBTUH. The Acid Gas Flare is a control device for control of emission of H2S. The flare will also control emissions of CH4 and VOC.

PROCESS GASOLINE STORAGE AND DISPENSING STATION - UNIT BE108 AT BELLAGIO

NAME:

Process Type: 42.003 (Gasoline Marketing (except 42.001 & 42.002))

Primary Fuel: N/A

Throughput: 26400.00 GAL/MO

Process Notes: THE EMISSION UNIT IS A 3,700 GALLON STORAGE TANK EQUIPPED WITH A STAGE 1 VAPOR RECOVERY SYSTEM BASED ON CARB EO G-70-132 SERIES FOR TANK TRUCK DELIVERY OF GASOLINE AND A STAGE 2 VAPOR CONTROL SYSTEM BASED ON CARB EO G-70-17 FOR GASOLINE DISPENSING. THROUGHPUT OF GASOLINE IS LIMITED TO 26,400 GALLONS/MONTH AND 264,000 GALLONS/YEAR FOR THIS EMISSION UNIT.

	(P) Good combustion practices, including good equipment design, use of gaseous fuels for good mixing, and proper combustion techniques consistent with the manufacturer's recommendations to maximize fuel efficiency and minimize emissions (see notes below)
Est. % Efficiency:	
Cost Effectiveness:	0 \$/ton
Incremental Cost Effectiveness:	0 \$/ton
Compliance Verified:	Unknown
-	Good combustion practices shall include monitoring of the flue gas oxygen content, combustion air flow, fuel consumption, and flue gas temperature. These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit. PSD permit requires an annual stack test for VOC. If VOC < 75% of the permit limit, the frequency of the testing may be reduced to once every 2 years. If result of any subsequent test exceeds 75% of the permit limit, resume annual testing.

PROCESS NAME:	Firetube Boiler Nos. 1 and 2 (4-08, EQT 324 & 5-08, EQT 325)
Process Type:	13.390 (Other Gaseous Fuel & Gaseous Fuel Mixtures)
Primary Fuel:	NATURAL GAS AND VENT GAS

63.00 MM BTU/H Throughput: **Process Notes:** Boilers are subject to 40 CFR 60 Subpart Dc. Boiler No. 1 is also subject to 40 CFR 60 Subpart DDD. **POLLUTANT NAME:** Nitrogen Oxides (NOx) CAS Number: 10102 **Test Method:** EPA/OAR Mthd 7E **Pollutant Group(s):** (InOrganic Compounds, Oxides of Nitrogen (NOx), Particulate Matter (PM)) **Emission Limit 1:** 2.7500 LB/H HOURLY MAXIMUM **Emission Limit 2:** 30.0000 PPMVD @ 3% O2 ANNUAL AVERAGE **Standard Emission:** Did factors, other then air pollution technology considerations influence the BACT decisions: U BACT-PSD **Case-by-Case Basis:** Other Applicable Requirements: OPERATING PERMIT **Control Method:** (B) Flue gas recirculation and good combustion practices, including good equipment design, use of gaseous fuels for good mixing, and proper combustion techniques (see notes below) Est. % Efficiency: **Cost Effectiveness:** 0 \$/ton 0 \$/ton **Incremental Cost Effectiveness: Compliance Verified:** Unknown **Pollutant/Compliance Notes:** Aggregate NOx emissions from the boilers are capped at 10.05 TPY (GRP 11). Facility Name:	UTILITY PLANT	Permit Date: 12/02/2014 (actual)

Facility Contact:	MAURO FENOGLIO (281) 874-8074 FRS Number: unknow					unknown
Facility Description:	In support of the new PET (polyethylene terephthalate) unit and new PTA (terephthalic acid) plant proposed by M&G Resins USA LLC, the company also proposes a Utility Plant that will consist of either one of two options. All steam generated from the Utility Plant will be used as process steam. There is no steam driven electrical generator.			SIC Code:	4911

ATTACHMENT #4 NYC – DOC Rikers Island NO₂ 1-Hour Modeling Analysis Report

1 Introduction

This report satisfies the New York State Department of Conservation's (NYSDEC) August 6, 2018 request for an air dispersion modeling analysis to demonstrate that facility-wide NO₂ emissions comply with the 1-hour NO₂ National Ambient Air Quality Standard (NAAQS). This modeling analysis is being submitted as part of the Title V renewal permit application for Rikers Island in Bronx, NY (Rikers). The analysis was performed using the USEPA-approved AERMOD dispersion model.

The facility maintains a power plant, boiler house, engine generators that have the capability to participate in peak load management (PLM) programs, and multiple emergency generators that are distributed throughout the property. The power plant consists of two, 7.5 megawatt (MW) natural-gas-fired, simple-cycle gas combustion turbines equipped with duct-firing heat recovery steam generators and one, 1.5 MW emergency black start engine generator. The boiler house consists of eight, 96 MMBTU/hr dual fuel-fired boilers. There are 19 diesel fuel fired engine generators that have the capability to participate in PLM programs, each rated between 800 kilowatts (KW) and 1,100 KW. In addition, there are several exempt emergency backup-generators located throughout the facility.

1.1 Equipment Description

1.1.1 Power Plant

The power plant consists of two, 7.5 MW Solar Taurus 70-10301S natural gas fired, simple cycle gas turbines equipped with duct firing heat recovery steam generators, and one 1.5 MW emergency black start engine generator. The power plant provides electrical power and thermal energy to the facility. The exhaust from each turbine is vented to a separate stack located outside the powerhouse. The black start engine generator is used for emergency purposes only, and is tested periodically. Since it is considered to be an intermittent source it was not included in the modeling analysis, based on applicable USEPA guidance¹.

1.1.2 Boiler House

Eight 96 MMBTU/hr boilers, each firing natural gas as the primary fuel and distillate oil as backup, exhaust through three separate stacks located adjacent to the Boiler House. The boilers provide thermal energy to the facility and primarily operate as a backup or supplemental to the power plant.

1.1.3 PLM Engines

There are 19 internal combustion engines at Rikers that have the option of enrolling in PLM programs with Con Edison. In the current Title V permit these 19 engines are subject to a NO_x emissions cap of 22.5 tons/year. These 19 engines (four 1,100 kW, two 800 kW, three 900 kW, one 625 kW, and nine 1,150 kW) fire diesel fuel oil and are located at various locations throughout Rikers. Each engine exhausts locally. Fourteen of these engines have undergone a NO_x RACT analysis per 6 NYCRR 227-2 in March, 2020. The RACT analysis demonstrated that RACT for these engines is no control, as defined in New York State's DAR-20, and are therefore in compliance with Part 227-2, either at their existing NOx variance limit in the current Title V permit or at a new NO_x limit based upon the most recent stack testing conducted in 2018. The remaining five engines were not tested in 2018 and therefore currently do not participate in a PLM program. These engines may be used for emergency purposes only and therefore were not included in

¹ EPA Memorandum, "Additional Clarification Regarding Application of Appendix W, Modeling Guidance for the 1-Hour NO₂ National Ambient Air Quality Standard," March 1, 2011.

the modeling analysis, based on applicable USEPA guidance that they are classified as intermittent sources.²

1.1.4 Emergency Engines

The facility has approximately 51 emergency diesel engines scattered throughout Rikers Island for emergency support. These engines are only used for emergency back-up and are operated periodically for maintenance and testing purposes. As per EPA's guidance, these engines are considered to be intermittent sources and therefore, not included in the modeling analysis.

1.2 Source Parameters and Emission Rates

An air quality impact analysis was conducted to evaluate potential impacts from Rikers with respect to the NO₂ 1-hour NAAQS. Stack exhaust parameters for the turbines with duct firing (cogeneration plant), boilers, and PLM engines were obtained from the Title V permit application.

For the cogeneration plant, NO_x emission rates were calculated based on the proposed NO_x emission limit of 15 parts per million (ppm) at 15% O_2 from the turbines and duct burners, as demonstrated in the LAER analysis dated March 2020. The modeling analysis assumes that both turbines operate continuously at maximum capacity with duct firing year-round as a conservative estimate.

For the boilers, NO_x emission rates were calculated based on the NO_x RACT emission limit of 0.12 pounds per MMBtu as demonstrated in the March 2020 NO_x RACT analysis. The modeling analysis assumes that all eight boilers are operating continuously at maximum capacity. This is a conservative assumption since two of the eight boilers are currently not operational.

The Rikers PLM engines have historically participated in the New York Independent System Operator (NYISO) Special Case Resource (SCR) and Con Edison Coordinated Demand Response Programs (CDRP) and are dispatched between 1:00 PM and 7:00 PM Monday through Friday when the grid is peaking in the summer. In the last decade, the facility has never been called during the winter season. However, for modeling purposes, the engines are assumed to be running continuously assuming operation between 1:00 PM and 7:00 PM throughout the year. The modeling analysis uses a specific NO_x RACT limit and maximum allowable enrolled kW capacity for each engine to demonstrate compliance with the 1-hour NO₂ standard. New conditions reflecting these kW limits by engine are included in the Title V permit renewal application.

Table 1 presents the stack parameters and NO₂ emission rates used in the analysis for the boilers and the cogeneration plant. **Table 2** presents the stack parameters and NO₂ emission rates used in the analysis for the PLM engines.

² EPA Memorandum, "Additional Clarification Regarding Application of Appendix W, Modeling Guidance for the 1-Hour NO₂ National Ambient Air Quality Standard," March 1, 2011.

⁽¹⁾ Stack exhaust parameters obtained from Title V permit application.

⁽²⁾ Revised proposed NOx RACT emission limit as demonstrated in the March 2020 NOx RACT analysis.

(3) Operation of the four PLM engines located at OBCC have the potential to exceed the 1-hour NO₂ standard at the current NO₂ emission limits; therefore, these engines have been excluded from this 1-hour NO₂ modeling analysis and will not operate under PLM programs until they can demonstrate compliance with the standard.

1.3 Methodology for Predicting NO₂ Concentrations

This section presents the methodologies, data, and assumptions used to conduct the 1-hour NO₂ modeling analysis for Rikers.

1.3.1 Dispersion Model

The dispersion modeling analysis was performed using the EPA AERMOD dispersion model³. The AERMOD model calculates pollutant concentrations from one or more points (e.g., exhaust stacks) based on hourly meteorological data, and has the capability of calculating pollutant concentrations at locations when the plume from the exhaust stack is affected by the aerodynamic wakes and eddies (downwash) produced by nearby structures. Computations with the AERMOD model to determine impacts from the facility were made assuming urban dispersion coefficients, regulatory default options (stack tip downwash, elevated terrain, calm winds processing, etc.), inclusion of building wake, the use of flagpole receptors, and the urban boundary layer option.

1.3.2 Meteorological Data

The modeling analysis was performed using latest recent five-year meteorological data set from the nearest representative National Weather Service (NWS) station, consisting of surface data from LaGuardia Airport, NY and concurrent upper air data from Brookhaven National Laboratory in Upton, NY (2015 to 2019). The NYSDEC supplied the meteorological dataset, which was processed with the AERMET Version 19191 processor.

1.3.3 Receptor Network

Receptor data, including ground level elevations and coordinates, were used in the AERMOD model. Four uniform ground-level Cartesian receptor grids were utilized. The first is a coarse Cartesian receptor grid with receptor spacing of 500 meters extending out from 5 km to 10 km in all directions from center of the Rikers Island. The second receptor grid is an intermediate Cartesian receptor grid with 250 meter receptor spacing, extending out from 2 km to 5 km in all directions from the center of the Rikers Island. The third receptor grid is a fine Cartesian receptor grid with 100 meter spacing, extending out from 1 km to 2 km in all directions from the center of the Rikers Island. The third receptor grid is a fine Cartesian receptor grid with 100 meter spacing, extending out from 1 km to 2 km in all directions from the center of the Rikers Island. The fourth receptor grid is a fine Cartesian receptor grid with 75 meter spacing extending out to 1 km from north, south, east and west boundaries of the Rikers Island. Discrete ground level receptors on Rikers Island the public has access, including recreation spaces, were also modeled. A terrain pre-processor program was used to determine the representative ground elevations for each receptor.

1.3.4 Modeling Analysis

EPA has developed guidance for assessing 1-hour average NO₂ concentrations for compliance with the NAAQS.⁴ This guidance along with other guidance from the California Air Pollution Control Officers Association (CAPCOA)⁵ was used to develop representative 1-hour background concentrations that were

User's Guide for the AMS/EPA Regulatory Model (AERMOD). 454/B-19-027, August 2019.

⁴ EPA Memorandum, "Additional Clarification Regarding Application of Appendix W, Modeling Guidance for the 1-Hour NO₂ National Ambient Air Quality Standard," March 1, 2011.

⁵ Modeling Compliance of the Federal 1-Hour NO₂ NAAQS", CAPCOA Guidance Document, October 27, 2011, <u>http://www.valleyair.org/busind/pto/Tox_Resources/CAPCOANO2GuidanceDocument10-27-11.pdf</u>

added to the concentrations predicted from the modeled project sources. Based on EPA's March 1, 2011 Clarification memo, multi-year averages of the 98th percentiles of the available background concentrations by season and hour-of-day were used in the modeling analysis. The background data was provided by the NYSDEC.

For the seasonal hour-of-day approach, the 3rd highest value from each season and hour-of-day combination was used to represent the 98th percentile seasonal background concentration from the Queens College II background monitoring station based on a maximum of a 90-92 value seasonal dataset. Seasonal hour-of-day is determined by organizing all of the NO₂ concentrations by the hour of the day (1 AM, 2 AM, 3 AM, etc.) for each season of the year in descending order and selecting the third-highest NO₂ concentrations for each hour of the day and season. The process is repeated for the recent three years (2017-2019) of data.

1-hour average NO₂ concentration increments from the modeled sources were estimated using the AERMOD model's PVMRM module to analyze chemical transformation within the model. The PVMRM module incorporates hourly background ozone concentrations to estimate NO_x transformation within the source plume. Ozone concentrations were obtained from NYSDEC for the NYSDEC Queens College II monitoring station since that is the most representative ozone monitoring station for the years 2015-2019. An initial default NO₂ to NOx ratio of 50 percent at the source exhaust stack was used for the turbines and boilers, and 20 percent⁶ for the PLM engines, which is considered representative for this source type. A review of the USEPA's NO2/NOx In-stack Ratio (ISR) Database (NO2_ISR_database.xls and NO2_ISR_alpha_database) determined that this value is more conservative than the average values of similar sized units.

1.4 Analysis Results

The air quality modeling analysis determined the maximum predicted 1-hour NO₂ concentrations from Rikers. The results of the analysis are presented in **Table 3**.

Modeled Pollutant	Averaging Period	Maximum Impact (µg/m³)	Background Concentration (µg/m³)	Total Concentration (μg/m³)	NAAQS (μg/m³)			
NO ₂	1-Hour		-	187.8(1)	188			
Note (1) The 1-Hour NO ₂ concentration presented is the maximum of the total 98th percentile 1-Hour NO ₂ concentration predicted at any receptor using seasonal-hourly background concentrations and using the PVMRM module.								

Table 3Maximum Predicted 1-hour NO2 Concentrations

The results of the modeling analysis determined that the modeled 1-hour NO₂ concentrations from Rikers, when added to ambient background levels were not predicted to exceed the 1-hour NAAQS. Therefore, no significant adverse air quality impacts are predicted with the project. In order to avoid potential exceedances of the 1-hour NO₂ standard, the facility is proposing new permit conditions defining limits

on the maximum enrolled capacity for the PLM engines, as described above. With these conditions in place, no significant adverse air quality impacts are predicted with the projects' sources.
